Since this study was essentially exploratory in nature, it was impossible to foresee all the problems that would be involved in collecting the required data. The procedures utilized were therefore modified somewhat at various stages to surmount the obstacles that presented themselves. The more important modifications are described at appropriate points in this report.

SOURCES OF STUDY DATA

The data used in this project were obtained from the following sources:

1. Reports of critical incidents involving mathematics and science skills, such reports collected from technicians on the job and from first-line supervisors
2. Questionnaires that elicited training and work experience information from electronics and chemical technicians and supervisors
3. Hiring specifications obtained from personnel offices employing chemical and electronics technicians
4. Interviews with personnel officers in the industries participating in this study
5. Questionnaires mailed to instructors of electronics courses in California junior colleges
6. Interviews with chemistry instructors from junior colleges located in northern California
7. Printed instructional materials from the Air Force and Naval training programs in electronics, from the Northern California Electronics Apprenticeship Advisory Committee, and from apprenticeship training programs of two San Francisco Bay Area Naval installations.

Although the data obtained from these sources were analyzed primarily to identify critical mathematics and science requirements, much of the information had a bearing on general problems of selection, training, and utilization of technical manpower resources. The latter aspects of this information are included and discussed in the report

because of their important implications for many facets of technical training.

Two samples of technicians and supervisors were employed in the collection of critical incidents related to mathematics and science requirements. In the electronics field, data were obtained from 197 technicians and 62 first-line supervisors in 13 different electronics firms; in the chemical area, from 81 technicians and 31 supervisors in 7 different chemical companies. All of the firms participating in this study are located within the Greater San Francisco Bay Area.

The companies represented in the survey varied in size from those employing less than 20 technicians to those employing more than 500. The companies also differed as to the type of operations they emphasized. Some of the firms concentrated primarily upon research and development; others were primarily concerned with production. For this study, both the electronics and chemical firms were selected to provide, insofar as possible, a cross section of the industries involved and a cross section of the different types of technicians employed. Initial selection was based upon consideration of both size and operational nature of the various companies.

The selection of electronics firms to be surveyed was facilitated by the assistance of an officer from an organization comprising personnel officials from various northern California electronics firms. Since a similar organization did not exist for the chemical industry, the selection of chemical firms was aided by suggestions and recommendations offered by each company representative interviewed. The responses made by the industries were most gratifying. With but two exceptions, every company contacted showed an interest and willingness to participate in the study.

Though fewer in number than the electronics firms selected, the chemical firms included in the sample were considered fairly representative of the chemical industry in the San Francisco Bay Area. In fact, only one or two major chemical firms in this geographic area were not included in the study; in each instance another firm engaging in almost identical activities was sampled. It is thought that the sampling of both the electronics and the chemical industries was about as representative of firms in this region as could be obtained on the basis of the information available at the time the study was made.

PROBLEMS ENCOUNTERED

The desire of the investigators and of the participating companies to collect the study data with as little interference and expense to each

company as possible necessitated, for the most part, the selection of samples by personnel office representatives of each firm. Thus, for this and additional reasons, the adequacy of the sampling within the participating firms is difficult to determine.

One of the most trying problems encountered was the absence of available data for the defining and locating of populations to be sampled. It was found that even the California State Employment Service was unable to provide data that would assist in determining where electronics or chemical technicians might be employed. This situation is due, perhaps, to the relative newness of these occupational classifications. In general, the investigation was concerned with persons whose work and training would place them in an intermediate position between the skilled workmen on the one hand and the graduate engineer on the other. Yet hiring practices in the various industries were not sufficiently standardized to permit adherence to this distinction. It was finally decided to accept each company's definition of a technician. If he was listed as a technician, he was included in the sample.

Another problem in determining representativeness of the sample resulted from the procedure employed in soliciting reports of critical incidents. For example, in all instances in the electronics area, personnel officers preferred to contact the technicians rather than to have them contacted directly by the research staff. Moreover, except in one chemical company and in one electronics company, participation in this study by the technician was entirely voluntary. Undoubtedly the number of persons responding was related to the degree of enthusiasm evidenced by each personnel officer.

Still another problem had to do with the fact that there was no way of determining the per cent of technicians or supervisors responding from each plant. Factors such as plant expansion, labor turnover, and promotion prevented an accurate count of the total number of technicians. The number of questionnaires distributed in each plant represented only an approximation of the total number of men employed.

Nevertheless, in the face of these problems, there is some evidence that the sampling procedures produced a more adequate sample of the electronics technicians than might have been expected. The descriptive data from the questionnaire instrument—data such as those relating to age, experience, and training—were analyzed separately for one company that required all of its technicians and supervisors to complete the instrument. The results were found to be almost identical to those for the rest of the sample.

The sampling of chemical technicians did not pose so difficult an enterprise as that for the electronics groups. Typically, there are fewer chemical technicians employed in each plant and a smaller ratio of technicians to supervisors than in electronics firms. Thus it was possible to get fairly complete coverage of the chemical technicians in each plant because of the close contact between management and the men. Furthermore, the labor situation appears generally quite stable in the chemical industry at the present time.

With but one exception, an effort was made in each instance to cover an entire chemical company. The exception arose because of the preference of a large oil firm to restrict the sampling to a specific in-service training class. The plant officials reasoned that this method would provide the best cross section of employees in the absence of some random selection technique.

A further check bearing on the adequacy of the samples was available. After the descriptive data on the technicians were analyzed, the findings were discussed with personnel officials and members of supervisory staffs of a company employing large numbers of both electronics and chemical technicians. The company has plants in both northern and southern California. These persons expressed the opinion that the description of technicians provided in this study would apply, in general, to technicians employed in their plants.

All in all, knowledge regarding population characteristics as derived from these samples leaves much to be desired. Little previous research was of any value in designing this study. However, it should be remembered that this was intended as an exploratory study for ideas that could be followed up by more definitive studies. Although the samples are considered adequate for the purposes of this study, the reader is cautioned about the danger of overgeneralizing the findings described in this report.

STUDY METHODS

The methods employed to collect the data required for the study project were primarily (1) two questionnaire instruments; and (2) interviews.

One of the questionnaires was designed for electronics and chemical technicians and supervisors; the other, for junior college instructors of electronics courses. The questionnaire directed to technicians and supervisors was divided into two parts. The first section was designed to obtain a description of the technician or the supervisor—his work experience, his educational background, and his plans for future training. The second part was designed to elicit reports of critical incidents

in which reliance on the proper use of some mathematical or scientific skill is demonstrated as vital to the technician in a certain job performance. It should be noted at this point that the word "science" is used here and throughout the report in its general sense only and has no special or restricted meaning other than that denoted in the critical incident response classifications.

The critical incident technique developed largely by Flanagan and others at the American Institute for Research requires an "expert" qualified to judge the effectiveness of a particular type of behavior.[1] In this instance, the "experts" were technicians and their supervisors. Each of these "experts" was asked to render a specific description of a behavioral situation or incident designed to illustrate effective or ineffective behavior, as opposed to a vague description of an effective person or of his effective personal traits. The reports of incidents sought in this study were couched in terms of mathematics and science requirements.

The critical incident technique allows almost complete freedom of response. The individual is restricted only to the extent that he must report an actual incident, recently observed. The respondent is not restricted by a predetermined list of responses as in the case of the usual check-list type of questionnaire. Although it is quite possible that the critical incident technique may evoke responses rather similar to those elicited by a check list, the element of freedom in the use of the former is likely to encourage the production of a wider, more unique range of responses than is likely to be produced in the latter.

In general, previous research has indicated that the questionnaire approach to the critical incident technique is not quite as effective as the group interview approach.[2] More complete responses tend to be given in the small group situation, assisted by an administrator. Even so, the questionnaire approach appeared more feasible for this project in view of the desirability of collecting the data with a minimum of distraction and expense to the participating companies. The respondents, therefore, were asked to complete the questionnaire outside their working hours.

Technician's Questionnaire

Identical questionnaires were administered to both technicians and supervisors, except that each supervisor was asked for incidents drawn

[1] J. C. Flanagan, "Critical Requirements for Research Personnel: A Study of Observed Behaviors of Personnel in Research Laboratories." Pittsburgh, Pennsylvania: American Institute for Research, 1949.
[2] *Ibid.*, pp. 11-12.

from observations of men he had supervised. The technician's questionnaire is shown in the pages that follow.

Technical Occupations: Critical Mathematics and Science Requirements

The Bureau of Industrial Education of the California State Department of Education in co-operation with the University of California is making a study of the mathematics and science requirements for certain technical occupations. You as experienced personnel in these occupations are the ones who are best qualified to provide this information. Because of your experience, you have had many opportunities to observe situations in which the possession or lack of certain mathematical and scientific skills has influenced job performance.

Following are some questions the last four of which we would like you to answer by telling us of an experience or by describing a case that you have noticed within the *last six months*. In short, we want an illustration of an experience that has happened to you or of an incident that you have seen happen to someone else with your job classification.

Your co-operation is very important to this project in that the findings may suggest ways of improving the training for your type of occupation. Thank you very much for your co-operation.

Part I

Please read each question carefully and answer as completely as you can.

Name _____ Age _____ Sex _____

Address _____ Phone _____

Name of firm for which you work _____

Education (circle highest grade completed) High School 1 2 3 4; Junior College 1 2 3 4; College or University 1 2 3 4; Date completed _____

Current job classification or job title _____

What are your duties? _____

_____

How long have you been on your current job? _____

List the titles of your four most recent jobs _____

_____

How long have you worked as a technician? _____

Where did you receive specific training for your present job? (e.g., high school, junior college, armed forces, on the job, etc.) _____

How did you first become interested in this type of work? _____

_____

List below all of the formal courses in mathematics and science you have taken and then all those you plan to take (use back of this sheet if necessary).

COURSE	WHERE TAKEN (e.g., high school)	COURSE	WHERE TAKEN

Do you plan to take additional mathematics and science courses in the near future?

Yes____ No_____. If so, what do you plan to take?

Would you be willing to be interviewed at a later date if further information is needed for this project? Yes____ ; No_____.

Part II

1. **Suppose you were a member of a board that screens applicants for the type of job you have. What skills in mathematics and science would you look for?**
   Mathematics?
   Science?
2. **Think of an occasion, within the past six months, when your work, or the work of someone you know with the same job as yours, was made easier because of a knowledge of mathematics. *Describe the situation.* Tell what particular mathematical skills were involved. (Use the back of this sheet if necessary.)**
3. **Now think of an occasion, within the past six months, when your work, or the work of someone you know with the same job as yours, was made easier because of a knowledge of science. *Describe the situation.* What scientific knowledge was involved? (Use the back of this sheet if necessary.)**
4. **Think now of an occasion, within the past six months, when your work, or the work of someone you know with the same job as yours, was made more difficult because it required certain mathematical skills that were not known. *Describe the situation.* What mathematical skills were needed? How was the job finally done? (Use the back of this sheet if necessary.)**
5. **Now think of an occasion, within the past six months, when your work, or the work of someone you know with the same job as yours, was made more difficult because it required certain science skills that were not known. *Describe the situation.* What science skills were needed? How was the job finally done? (Use the back of this sheet if necessary.)**

Instructor's Questionnaire

Another questionnaire was submitted to all California junior college instructors of electronics courses. This questionnaire was designed to elicit information regarding the instructor's background, what mathematical and scientific skills he considered essential to technicians, his recommendations for screening students for technical training programs, and what he considered to be the major problems involved in training technicians.

Interviews

During the process of collecting data, the research staff had the opportunity to interview a number of persons involved in the training, employment, and supervision of technicians. The personnel director or his representative for every company participating in the study was interviewed, and frequently it was possible to question other management personnel. Although the interviews were used primarily for fact-finding purposes, occasionally the research staff was able to discuss tentative findings with the personnel being interviewed. This provided an opportunity to verify findings from one situation with those of another.

Interviews were also conducted with representatives of the chemistry departments of 12 junior colleges in northern California. The purpose of these interviews was to determine the attitudes of chemistry instructors toward programs for training students to become chemical technicians and to obtain the instructors' suggestions regarding the mathematics and science skills considered essential to such a program.

Chapter III

DESCRIPTIONS OF TECHNICIANS AND SUPERVISORS

Very little objective information that would have been of value in defining and identifying those characteristics most common to either the electronics or the chemical technician was available at the time this study was initiated. In view of this lack of essential information, it was deemed necessary to collect primary background data for the purpose of establishing general characteristics possibly distinctive of employees so classified.

FUNCTIONS OF BACKGROUND DATA

Used within limits imposed by certain previously explained sampling restrictions, the background data would serve two functions. First, they would provide descriptions of workers who become electronics and chemical technicians. Second, and perhaps more important, personnel training and work experience descriptions provided by this study would permit, indirectly, certain inferences relating to critical mathematics and science training levels. If, for example, a large number of technicians are shown to have had no formal training beyond high school, and if their high school training included no formal courses relating to their work as technicians, then the amount of formal mathematics and science training frequently suggested as critical for this level of work might be seriously questioned.

Of course, a lack of formal training among employees could reflect a lack of job definition, a dearth of fully qualified technicians, or both. Some indication of which alternative is true might be obtained by examining the differences between supervisors and technicians with regard to mathematics and science training. To pose a hypothetical example: a finding that shows supervisors to possess a greater amount of formal training in these fields than technicians might indicate more strongly that mathematical and scientific skills are essential to job success than a finding that shows both groups to possess similar types and levels of training. If the latter finding were true, then advancement on the job would have to be explained on some basis other than that of mathematics and science training.

TABLES AND COMMENTARIES

In the pages that follow, descriptive data derived from the questionnaires directed to electronics and chemical technicians and supervisors are reported in Tables 1 through 12. Each table is accompanied by analytical and explanatory comments upon those data considered most significant. To facilitate comparisons between the electronics and chemical technicians and supervisors, data from both groups have been combined and presented in identical classifications in each table.

Age Distribution

The distribution by age of the chemical and electronics technicians and supervisors is shown in Table 1. The mean age for the electronics technicians is 32.6 years. Approximately two-thirds (63.9 per cent) of these technicians are within the age range of 25 to 39 years; 17.3 per cent, below the age of 25. The electronics supervisor, with a mean age of 35.7 years, is approximately three years older, on the average, than the electronics technician. Almost three-fourths (72.2 per cent) of the supervisors are within the age range of 25 to 39 years; only 1.6 per cent are below the age of 25.

Chemical technicians and supervisors tend to be slightly older than electronics personnel. The mean age for the chemical technicians, 33.5

Table 1

AGE DISTRIBUTION OF ELECTRONICS AND CHEMICAL TECHNICIANS AND SUPERVISORS

Age range (in years)	ELECTRONICS		CHEMICAL	
	Technicians (per cent)	Supervisors (per cent)	Technicians (per cent)	Supervisors (per cent)
20-24	17.3	1.6	13.6	0.0
25-29	27.9	21.3	22.2	9.7
30-34	19.8	27.9	22.2	32.3
35-39	16.2	23.0	18.5	29.0
40-44	8.1	9.8	14.8	12.9
45-49	6.1	13.1	4.9	6.4
50+	4.6	3.2	3.7	9.7
TOTAL	100.0	100.0	100.0	100.0
Mean age	32.6 years	35.7 years	33.5 years	37.1 years

years, is, on the average, about four years below that for the chemical supervisors, 37.1 years. Although 13.6 per cent of the technicians are below the age of 25, no supervisor was found to be younger than 25.

Educational Levels and Differences

The educational levels for the chemical and electronics technicians and supervisors are shown in Table 2. The mean educational level is 13.1 years for the electronics technician and 13.9 for their supervisors. Approximately 56 per cent of the technicians have had formal education beyond high school, as have 59 per cent of their supervisors. Of the technicians receiving education beyond high school, more have attended junior colleges than have attended four-year institutions; and more supervisors than technicians have attended either junior colleges, four-year institutions, or both.

This educational difference between electronics technicians and supervisors does not appear great enough to indicate years of schooling as a major factor in advancement to supervisory positions. A possible explanation for absence of greater disparity between these two groups in the matter of school training might derive from the relative newness of the electronics industry.

Table 2

YEARS OF FORMAL EDUCATION OF ELECTRONICS AND CHEMICAL TECHNICIANS AND SUPERVISORS

Number of school years completed	ELECTRONICS		CHEMICAL	
	Technicians (per cent)	Supervisors (per cent)	Technicians (per cent)	Supervisors (per cent)
8	0.0	1.6	0.0	0.0
9	2.5	0.0	2.5	0.0
10	3.0	0.0	0.0	0.0
11	1.5	4.9	0.0	0.0
12	36.5	34.4	25.9	3.2
13	11.7	6.6	17.3	0.0
14	31.0	19.7	28.4	0.0
15	5.1	0.0	11.1	0.0
16	8.6	22.9	14.8	38.7
17	0.0	6.6	0.0	0.0
M.A. level	0.0	3.3	0.0	6.4
Ph.D. level	0.0	0.0	0.0	51.6
TOTAL	100.0	100.0	100.0	100.0
Mean educational level	13.1 years	13.9 years	13.6 years	17.2 years

It is conceivable that when the rapid expansion began in the electronics industry, few technicians qualified by virtue of formal training were available. Thus many high-ability secondary school graduates were hired, and these, over the years, have received sufficient on-the-job training to advance to supervisory levels. Now an increasing number of technicians are being prepared in various training programs; a large proportion of these are receiving the equivalent of junior college training. The technician's chances, therefore, of advancing to a supervisory position with less than a two-year junior college course would seem to diminish. This, of course, is a matter of conjecture, and further study is needed for more positive indications.

The mean educational level of 13.6 years for the chemical technicians is only slightly higher than that of 13.1 years for the electronics technicians. The chemical supervisors, on the other hand, are more highly trained than personnel in the other groups. More than one-half of these have completed requirements for the doctorate. Almost 97 per cent reported attendance at a college or university, but none indicated junior college work.

Differences in educational levels between the electronics and chemical supervisors reflect some very important differences in their types of work. The chemical technician tends to work under the direction of a supervisor who is most likely at least a college graduate. Further, he may be the only technician assigned to this supervisor. The electronics technician, on the other hand, may work under the direction of a lead man or foreman promoted from the technician ranks. One supervisor may be in charge of a fairly large number of electronics technicians.

Apparently the chemical technician is in a "dead end" occupation. Unless he obtains advanced degrees, his chances of advancement to supervisory positions are almost nonexistent. On the other hand, advancement opportunities for electronics technicians appear excellent because of promotions apparently based more on ability and experience rather than on formal academic training, at least at this time. However, an adequate supply of well-trained electronics technicians might change this picture appreciably in a relatively short while.

Length of Experience

Years of experience for both technicians and supervisors in electronics and chemical technology are shown in Table 3. The mean number of years of experience in electronics for the electronics technicians is 7.1 years. Approximately 42 per cent have less than 5 years of experience. Electronics supervisors have had, in supervisory experience,

a mean of 5.4 years. Their total technical experience could not be computed from the available response data.

The chemical technicians with a mean of 7.6 years appear, on the average, to have only slightly more work experience than electronics personnel. However, only 35.8 per cent of the chemical technicians have less than 5 years of experience. Their supervisors have a mean of 8.1 years of supervisory experience. Again this reflects, perhaps, the recent and more rapid growth of the electronics industry.

Table 3

ON-THE-JOB EXPERIENCE AS ELECTRONICS AND CHEMICAL TECHNICIANS AND SUPERVISORS

	ELECTRONICS		CHEMICAL	
Time worked (in years)	Technicians (per cent)	Supervisors (per cent)	Technicians (per cent)	Supervisors (per cent)
Less than 1	7.6	4.9	2.5	0.0
1–4	35.0	50.8	33.3	25.8
5–9	26.4	21.3	35.8	48.4
10–14	14.7	14.8	19.8	6.5
15–19	10.7	4.9	4.9	12.9
20+	3.6	0.0	3.7	6.5
None reported	2.0	3.3	0.0	0.0
TOTAL	100.0	100.0	100.0	100.0
Mean years of experience	7.1 years	5.4 years	7.6 years	8.1 years

Origins of Interest

As shown in Table 4, interest in the two technical occupations under consideration was found to stem from a variety of sources and motivational factors. The two sources mentioned most frequently by the electronics technicians were self-interest activities, such as hobbies and reading, and experiences in the armed forces. Few of the electronics technicians (14.7 per cent) listed school experiences as responsible for their interest in electronics.

Self-interest activities and school experiences were the two items most often listed by the chemical technicians as motivating their interests in chemical technology. For these persons, need for a job and financial opportunity were tied for third position on the scale of fre-

quency. For both groups, counseling apparently did not play a prominent role in the decision to enter these occupations.

Electronics and chemical supervisors were not asked to indicate sources of interest development in their respective fields.

Table 4

ORIGINS OF INTEREST IN OCCUPATIONS AS ELECTRONICS AND CHEMICAL TECHNICIANS

Origin of interest	Electronics technicians (per cent)	Chemical technicians (per cent)
Need for a job	4.6	14.8
Money and job opportunity	9.6	14.8
Information from relatives and friends	6.1	9.9
School experiences	14.7	21.0
Self-interest activities	35.5	29.6
Experiences in armed forces	29.9	11.1
None reported	8.1	3.7

Sources of Training

As shown in Table 5, the electronics technicians received their training from a variety of sources. Slightly more than one-fifth (21.8 per cent) reported that they received their training solely in schools, either in college or in high school. Military service schools provided training for 21.3 per cent. Only about 1 in 10 received his entire training on the job.

The proportions of the electronics supervisors receiving training from each of the various sources corresponded, percentage-wise, rather closely to those of the electronics technicians. A major exception, however, was the finding that fewer supervisors than technicians reported receiving their training solely in military schools. However, more of these supervisors than technicians indicated that they had received training from the combined sources of school, on-the-job, and military service.

The picture for the chemical technicians was quite different from that for the electronics technicians. Approximately 4 out of 10 (38.3 per cent) of the chemical technicians received their training on the job. Only about 1 in 20 received his training in military service. Except

Table 5

SOURCES OF TRAINING OF ELECTRONICS TECHNICIANS AND SUPERVISORS AND CHEMICAL TECHNICIANS

Source of training	ELECTRONICS		CHEMICAL
	Technicians (per cent)	Supervisors (per cent)	Technicians (per cent)
School	21.8	21.0	22.2
Military service	21.3	14.5	4.9
On-the-job	10.2	11.3	38.3
School and service	15.7	14.5	2.5
School and job	10.2	9.7	18.5
Service and job	9.6	8.1	6.2
School, service, job	8.6	16.1	1.2
None reported	2.5	4.8	6.2
TOTAL	100.0	100.0	100.0

for the preference of one major chemical company for hiring chemical technicians from among men trained as electronics technicians in military service schools, this ratio would be even more disproportionate. The rationale of this particular company is that persons so trained are more able to investigate and to solve problems than are chemical technicians trained in the junior college programs, i.e., the former generally know more about laboratory techniques than do the latter who take chemistry major transfer courses. The service-trained electronics technician, according to representatives of the company, is able to acquire needed chemical skills in a relatively short period of time.

Chemical supervisors were not asked to indicate the source of their training because of the large number of such personnel possessing advanced degrees.

Basis for Promotion

Both electronics and chemical supervisors were asked to indicate the basis on which promotions are made. Findings relevant to this question are shown in Table 6. The criteria for promotion most often mentioned by the electronics supervisors were personal qualities, leadership ability, and experience; those mentioned rather infrequently were formal education and training in mathematics and science. The criteria most frequently mentioned by the chemical supervisors were personal qualities and technical competence.

Table 6

ATTRIBUTES OR PROFICIENCIES CONSIDERED BY SUPERVISORS AS MOST IMPORTANT PROMOTIONAL FACTORS

Primary attribute or proficiency	Electronics supervisors (per cent)	Chemical supervisors (per cent)
Mathematics training	0.6	12.3
Science training	7.3	10.5
Training in electronics, electricity	5.5	3.5
Personal qualities	21.3	35.1
Leadership ability	26.8	3.5
Technical competence	7.9	26.3
Experience	27.4	1.8
Ability to verbalize	2.4	3.5
Formal education	0.6	3.5
TOTAL	100.0	100.0

The difference between the perceptions of the electronics supervisors and those of the chemical supervisors may reflect, to a large degree, the differing opportunities for promotion in the two fields. Advanced degrees, apparently, are almost always necessary for promotion to supervisory positions in the chemical industry. The chemical supervisors typically come from colleges and universities; the electronics supervisors are promoted most often from within the technician ranks.

Perceived Mathematics and Science Requirements

All of the technicians and supervisors were asked to indicate how much mathematics and science training they considered necessary to prepare a technician adequately for his job. Findings relative to perceived mathematics requirements are shown in Table 7, and those for science requirements are shown in Table 8.

Approximately one-fourth of the electronics technicians and more than one-fourth of their supervisors perceived training in elementary algebra as essential; 40 per cent of these technicians and over one-half of their supervisors favored mathematics training from basic courses through trigonometry.

On the other hand, the perceived requirements regarding certain mathematical skills for chemical technicians, as reported by these technicians and their supervisors, were quite different from those perceived for electronics technicians. Over 40 per cent of the chemical technicians

Table 7

TECHNICIANS' NEEDS FOR TRAINING IN MATHEMATICS: AS REPORTED BY TECHNICIANS AND SUPERVISORS

(not from critical incidents)

Mathematics needed (level of training)	ELECTRONICS		CHEMICAL	
	Technicians (per cent)	Supervisors (per cent)	Technicians (per cent)	Supervisors (per cent)
Trade mathematics only	6.1	1.6	0.0	0.0
Basic algebra	24.4	27.4	40.7	61.3
Geometry	2.0	4.8	3.7	6.4
Advanced algebra	5.6	1.6	4.9	3.2
Advanced algebra and plane geometry	1.0	0.0	3.7	0.0
Advanced geometry	0.5	1.6	1.2	0.0
Mathematics— basics through trigonometry	40.1	51.6	24.7	16.1
Mathematics— basics through calculus	6.1	1.6	6.2	9.7
Higher mathematics	0.5	0.0	0.0	0.0
None reported	13.7	9.7	14.8	3.2
TOTAL	100.0	100.0	100.0	100.0

and 61 per cent of their supervisors perceived simple algebraic skills to be adequate; about one-fourth of the chemical technicians and 16 per cent of their supervisors indicated mathematics training from basic courses through trigonometry as necessary.

A wide variety of other types of mathematics training were suggested for both the electronics and the chemical technician, but these were mentioned only a small number of times in each instance.

The perceived science requirements most often mentioned for the electronics technicians involved training in physics, in electronics, and in a combination of physics and electronics. For the chemical technicians, the most frequently mentioned essential science was chemistry or the combination of chemistry and physics.

Formal Training in Mathematics

Formal mathematics courses completed by electronics technicians and supervisors and by chemical technicians are shown in Table 9. Slightly more than 1 in 5 (21.3 per cent) of the electronics technicians reported having taken calculus; 28.9 per cent, training through trigonometry. Approximately 1 in 10 reported mathematics training of a type more

TOTAL	100.0	100.0	100.0

advanced than calculus. The major difference between electronics technicians and their supervisors in mathematical skills appeared in the field of advanced work. Almost 1 supervisor in 5 indicated formal courses beyond calculus, as compared to 1 technician in approximately 10.

Chemical technicians, in general, have had less training in mathematics than have electronics personnel. A relatively small per cent have had formal courses in calculus or in more advanced work. Analysis of the formal mathematics training for chemical supervisors was not considered appropriate because of the high educational level of these men.

Formal Training in Science

Classifying the reported science courses presented a much more difficult task than the classification of reported mathematics courses. Science, as it is now taught, does not fit into a neat hierarchial arrangement of courses. If an individual indicates the completion of science through physics, does this mean he already has had biology and chemistry? Some clues as to the possible sequence of courses might be obtained from the level of training indicated by the technician. If, for example, he had completed only high school and had taken only general science and electronics, then his training could be determined with fair accuracy. The science level of the college-trained technician, unless he indicated all of his courses, would have to be estimated. Thus, the data in Table 10 provide only a rough approximation of his science training.

The concentration in the physical sciences—electronics, chemistry, physics—is obvious. Electronics technicians and their supervisors appear quite equal in terms of science training. One major exception was noted in courses dealing exclusively with electronics. Here the supervisors report having taken fewer courses. Perhaps this indicates to some extent the lack of formal training courses available when the tremendous growth in the electronics industry started.

The chemical technician had, as might be expected, much more formal training in chemistry than had the electronics technician. Only a small proportion of the chemical technicians reported formal training in electronics. The electronics training obtained by this small group can be accounted for almost entirely by the previously noted preference of the particular chemical company for electronics technicians trained in the naval program.

In the context of this report it would not be meaningful to discuss the science courses taken by the chemical supervisors because of the advanced level of their training.

Table 10

Further Training Desired

Statistics reflecting the reported desire of both technicians and supervisors for further training are shown in Tables 11 and 12. Members of both the technicians' group and the supervisors' group plan to take additional mathematics and science courses. A much larger per cent of the electronics technicians than that of the chemical technicians affirmed this intent. Perhaps the desire for further training is prompted by the discernment of greater opportunities for advancement in the electronics field. Interestingly enough, more chemical supervisors plan to take additional formal course work than do the electronics supervisors, despite the showing, generally, of a much lower educational level among the latter group.

One implication readily apparent from these data is the need for educational institutions not only to offer training curriculums for new entrants into the technical field, but also to provide considerable advanced work scaled to the needs of technicians already on the job.

SUMMARY AND IMPLICATIONS

In general, the data discussed in this chapter indicate that most technicians do not require high-level mathematical and scientific skills. There is some indication of the need for practically oriented skills, i.e.,

toward laboratory techniques rather than toward abstract theory. Furthermore, the data suggest that perhaps many technicians possess higher-level skills than are being tapped by their present job. The disclosure that a large number of technicians plan to expand their capabilities by taking additional formal course work portends a greater supply of more highly trained technicians. But there is some evidence that the skills already available are not fully exploited. Does this mean that there will be an even greater waste of manpower resources? This problem should become a matter of the most serious concern on the part of both training institutions and industry.

Chapter IV

REPORTS OF MATHEMATICS AND SCIENCE INCIDENTS

As previously explained, the major purpose of distributing questionnaires to technicians and their supervisors was to elicit reports of incidents concerning the possession or lack of certain mathematical and scientific skills as a critical factor in the technician's job performance. A junior college electronics instructor with previous experience as an electronics technician assisted in the analysis of the reports of incidents submitted by electronics technicians and supervisors. A junior college chemistry instructor quite familiar with the work of the chemical technician assisted with the analysis of the reports of incidents submitted by chemical technicians and their supervisors.

TYPICAL REPORTS OF CRITICAL SCIENCE AND MATHEMATICS INCIDENTS

In the pages that follow, sample reports of critical incidents, selected at random from among the reports received, are shown in the exact language of the respondents (1) to illustrate both the nature and quality of the responses; and (2) to suggest certain difficulties involved in the analysis and classification of the responses. The samples are grouped to exemplify, in order of presentation, science incidents reported by electronics and chemical personnel and, similarly, mathematics incidents reported by these two groups.

Sample Reports of Science Incidents from Electronics Personnel

Reports illustrating critical science incidents as they relate to the job performance of electronics technicians follow:

1. In laying out the point-to-point wiring and cables for a regulated power supply, a technician mistakenly cabled together grid leads and filament leads. He assumed that because the power supply provided DC voltage, he didn't need to take usual circuit layout precautions. Had he known that the regulating circuitry employs high-gain amplifiers, he wouldn't have made this mistake. The time lost in correcting his error would have been saved if the technician had a greater knowledge of basic electronics.

2. One was a technician who spent a day trying to measure AC voltage with a DC meter.
3. A man was applying a five-pound weight to a component for test purposes. He didn't know if he should put the fish scale between the component and the weight, or if the component should be installed between the fish scale and the weight. A fellow employee helped him.
4. Heat elimination became a problem in a seal can. Using the principal of black conducting heat more readily than a shiny surface, we had the can black-annodized and helped to correct the problem.

Sample Reports of Science Incidents from Chemistry Personnel

Reports illustrating critical science incidents as they relate to the job performance of chemical technicians follow:

1. One technician tried to electrolyze a solution containing hydrochloric acid when such solutions normally should take sulfuric acid. The result was the production of chlorine gas that filled the laboratory. From high school chemistry he should have known that electrolyzing solutions containing hydrochloric acid produce chlorine.
2. A man rested an unshielded permanent magnet ammeter on a steel shelf. He did not realize that the magnetic field of the meter would be changed by the steel shelf. He had no knowledge of magnetic fields' behavior.
3. It was necessary to wash an item until all salt was removed. The technician used his knowledge of chemistry to use silver nitrate as a qualitative measure of the amount of chloride ion in the wash water.
4. The technician did not know enough about physics and the flow of fluids to realize that the pressure drop across a filter can be used to measure the flow rate through the filter as long as the filter did not become plugged. In addition, he didn't know that at a constant flow rate, the pressure drop could be used as an indication of the plugging of the filter.
5. Ran out of .1 N HCl. How do I mix more? Borrowed some from another room.
6. A man working with Na. He did not know $Na + H_2O$ are explosive and can cause a bad burn. The job was completed by another man with this knowledge.

7. Recently, some bricks we were firing for testing were ruined because the technician on duty was not familiar with the detrimental effect of thermal expansion and contraction upon refractory brick. A new set of test specimens was fired and the technician was enlightened as to the importance of thermal shock.

8. I had occasion to react a solution of copper sulfate with potassium cyanide. Knowing that copper sulfate is acidic when in solution, and that acid reacts with potassium cyanide to form highly toxic hydrogen cyanide gas, I was able to take precautions such as using proper ventilation and providing myself with a gas mask.

Sample Reports of Mathematics Incidents from Electronics Personnel

Reports illustrating critical mathematics incidents as they relate to the job performance of electronics technicians follow:

1. Recently in a structure shop, measurement was given in degrees from a certain spot. The people engaged in this type of work had to ask the inspector to convert degrees of arc to linear measure.

2. A fellow worker had to scale a mixture in certain proportions given in decimal system. The scale measured ounces and pounds. It took quite a bit of computing to get the mixture right because of a lack of simple mathematics such as the relations between the decimal system and ounces.

3. In determining the dimensions for a piece of sheet metal which was to have four $2\frac{1}{2}$ inch sections, I found that $2\frac{1}{2} \times 4 = 13$. This error was caught by a sharp-witted mathematician who checked the dimensions.

4. Recently one man took more than an hour to pad a 330 range switch by trial and error. He could have come close to the right values in minutes by figuring per cent change after one trial reading.

5. Had a man who could not find the time between pulses when he knew the number of pulses per second.

6. I recently observed an "A" technician who was unable to test a unit in pounds per square inch because his equipment measured in inches of mercury and he was unable because of his lack of knowledge on the subject to convert his readings.

Sample Reports of Mathematics Incidents from Chemistry Personnel

Reports illustrating critical mathematics incidents as they relate to the job performance of chemical technicians follow:

1. There was an occasion where 53.3 per cent alcohol was added instead of 95.5 per cent. When the mistake was discovered, about 47 per cent of the 53.3 per cent had been added. We had to calculate how much more 95 per cent achohol it would take to bring the solution up to the required concentration.
2. There was a situation where a new man was making up a 10 M HAc reagent. In adding his acid to the H_2O, he spilled in too much (about three liters). Instead of using algebra ratios, he guessed blindly and sent a sample to chemical control. He had to repeat this three times until by chance he got the right molarity.
3. Recently, the engineer for whom I work was called away. During his absence some physical tests were completed and, knowing the urgency of the project, I used my knowledge of graphing to compile and consolidate these results to make them readily available to the engineer upon his return.
4. One technician was not able to carry out a simple algebra calculation because he did not know the rules for removing multiple brackets.

TOTALS AND TABULATIONS OF CRITICAL INCIDENTS

A total of 123 critical mathematics incidents were reported by electronics personnel and 80 by chemistry personnel. The critical skills needed in these incidents and the frequency of need reported for each skill are shown in Table 13.

Electronics personnel reported 101 critical science incidents; Chemistry personnel, 45. The critical skills needed in these incidents and the frequency of need reported for each skill are shown in Table 14.

In examining these tables, the reader should bear in mind that one critical incident might involve more than one skill. Thus, the number of skills exceeded the number of reported incidents. The reader is also reminded that the relative importance of a skill can be measured to some extent by the frequency with which it is mentioned.

A most suprising feature of the data was the small number of critical incidents reported in either mathematics or science. On the basis of the questionnaires returned, approximately 40 per cent ' the electron-

ics technicians and 26 per cent of their supervisors reported no critical incidents involving mathematical skills; 49 per cent and 28 per cent, respectively, reported no incidents involving science skills. In the chemistry sample, 27 per cent of the technicians and 13 per cent of their supervisors failed to report critical incidents involving mathematical skills; 27 per cent of the technicians and 19 per cent of their supervisors reported no incidents involving science skills.

REPORTS AND TABULATIONS OF NONCRITICAL INCIDENTS

It was found that many of the responses concerning the use of mathematical and scientific skills in on-the-job incidents were too vague or too incomplete to be considered as reports of *critical* incidents; in general these reports were considered to represent noncritical ones. However, because such responses did report certain information involving mathematics needs, skills, and levels of training, they were analyzed and tabulated. This information in tabulated form is shown in Tables 15 and 16.

DISCUSSION OF CRITICAL INCIDENTS

The reasons for the small number of critical incidents reported are difficult to ascertain. Was there a real scarcity of reportable incidents?

—or did many respondents prefer not to complete this section of the questionnaire? Undoubtedly, for some of the respondents, the latter question may be answered affirmatively. The investigators are inclined to believe, however, that the lack of response regarding critical incidents can be largely attributed to the relative infrequency of such occurrences —that the work of the technician is such that it does not, in many instances, demand critical skills. This conclusion was directly supported by explanatory statements from many respondents for their failure to submit reports of incidents. Their jobs were indicated to be strictly routine and not of the nature requiring either mathematical or scientific skills.

The failure of so many technicians and supervisors to report incidents might be explained also by the practice of assigning to positions in

which critical skills are utilized only technicians possessing advanced mathematics and science training. If this were so, then technicians with high-level training should be able to report more incidents than those with less formal training. The data were analyzed to check this possibility. It was found that there was no relationship between the number of incidents reported and the technician's level of training. However, this generalization should be qualified somewhat by pointing out that only a small number of chemical supervisors failed to relate critical incidents and, as it was indicated in Chapter III, the educational level of these individuals is very high.

Finally, certain observations expressed by various training directors and supervisors further substantiated the lack of critical requirements for many technical jobs. Their comments were generally to the effect that, while hiring specifications often prescribe certain mathematical and scientific skills, there is frequently little relationship between these requirements and the work actually performed by the technician.

It is readily conceded that all technicians do not function at the same level, that some technicians work mainly as mechanics while others are engaged to a considerable degree in research. Thus critical skills might differ for each type of technician. Unfortunately the size of the sample did not permit meaningful study of this possibility. However, the nature and extent of data obtained by this study failed to indicate that technicians at any level really use high-level mathematics and science skills.

CHAPTER V

TRAINING CURRICULUMS

In the course of the interviews that were conducted with personnel and training directors of various electronics companies, it was discovered that men trained in military schools were held in high regard.[1] It was also disclosed that the hiring preferences of some companies were linked with the junior college in which the technician received his training. It was therefore maintained that, in view of these preferences, attention should be given in this study project to the various training programs for electronics and chemical technicians.

Material on electronics training curriculums was obtained from the U. S. Navy and the U. S. Air Force. Program outlines of electronics apprenticeship training at the Alameda Naval Air Station and the San Francisco Naval Shipyard were studied, as were the recommendations of the Northern California Electronics Apprenticeship Advisory Committee. In addition, by means of questionnaires and interviews, data were collected from junior college electronics and chemistry instructors who submitted information and opinions regarding junior college technician training.

Although the primary concern in examining this material was to collect further information on critical mathematics and science requirements, certain additional information which was judged to have a significant bearing upon the development of sound training programs was obtained and is reported in this chapter.

SERVICE SCHOOL AND APPRENTICESHIP PROGRAMS

Mathematics and science courses provided in service schools and in apprenticeship programs appear to differ little in content from those offered in other technical training programs for electronics technicians. Moreover, the range of course work in mathematics rarely, if ever, extends above the level of trigonometry. On the other hand, the method of teaching mathematics and science skills was noted to differ from that employed in many of the junior colleges.

In the Navy system—and this can also be said of the Air Force and the Naval Shipyard apprenticeship programs—the "craftsman" method is used. The emphasis is upon the doing of a skill rather than the

[1] It should be borne in mind that generally military service personnel have had several years of practical work experience while many junior college graduates have not

teaching of abstract theory for the sake of knowledge alone. Personnel able to demonstrate skill and efficiency, soundly grounded in fact and practice, and only moderately tempered by theoretical considerations are desired for placement in jobs of a crucial nature.

The following statement from the Bureau of Naval Personnel would seem to express the philosophy of both the service school and apprenticeship training programs in the teaching of mathematics and science as integral parts of electronics course work:

> The material has been given as much of a non-mathematical approach as felt feasible at this level of training. Instruction in mathematics is to be given only to the extent needed for understanding the basic concepts of mechanical and electrical principles. The specific objective for teaching the mathematical computations is to enable the trainee to grasp a better working knowledge of the principles. All extraneous computations are to be omitted. The understanding and application of various formulas is to be combined with the theory and practical work as required. There are two methods of teaching mathematics, abstractly and functionally. The former employs the logic of mathematical processes with abstract numbers and the latter is used in practical work. By teaching mathematics with the mechanical and electrical principles, the instructor can make the mathematical computations grow out of shop activities or practical situations, which will be meaningful to the trainee. Mathematical applications to problems that trainees encounter in their daily work are more meaningful and as a result the trainees are going to take a greater interest in their work. In most cases, the common knowledge level of mathematics has already been attained. Many of the mathematical processes that are involved in solving problems in mathematics and electricity should be the subject of a review supplemented with drills for outside study. However, in some cases, it may be necessary to treat the processes as new material followed immediately with application of the principle involved. For meaningful learning, economy of time, and effectiveness of instruction, it is desirable that the practice of integrating the teaching of mathematics with mechanical and electrical principles be applied.[2]

Apparently the service electronics schools are able to teach all necessary mathematics and science skills to high school graduates having but few previous mathematics and science courses. Officers of the Navy's Class A School on Treasure Island indicated that previous courses in these two areas are not necessary for success in the training program. Such courses as high school physics and mathematics are weighted in student selection only as indicators of possible interest in the electronics field.

Of course, service schools are working with a more select group of students than are junior colleges. Naval Class A schools select from approximately the top 15 per cent of recruits. Therefore, the apparent success of the service schools may be due, in large part, to the higher abilities of admitted students. The relatively favorable position of the service-trained electronics technician in the ranks of industry also may

[2] "Schedule of Topics and Topical Outline for Electricity-Electronics Training Series," Part I, July, 1956. Washington, D.C.: Bureau of Naval Personnel, 1956.

be explained chiefly by these higher abilities rather than, primarily, by the two or more years of training he acquires prior to discharge.

The Armed Forces, by knowing the exact requirements of those jobs for which the trainee is to be prepared, have an apparently important advantage over the junior college. Training provided under conditions where job requirements are definitely known can be patterned to the specific job, the course requirements standardized, and the serviceman's assignments regulated accordingly. However, this advantage would appear to apply significantly only for the duration of the technician's military career. Perhaps, therefore, one implication for junior college training is clear: that only the abler students should enroll in technical courses.

The work of the industry-employed technician, in contrast to that of his military counterpart, appears to vary from plant to plant and from job to job within a plant. Thus, training offered by nonservice technical schools may have objectives that are rather ill defined. In most instances the necessary mathematical and scientific skills are not identified nor are they likely to be identified until the roles and the functions of the technician are specified in a more satisfactory manner. Such uncertainty as to training objectives conceivably could lead to overtraining through attempts to anticipate every possible job demand. It might be decided that calculus and advanced physics, for example, should be incorporated in the curriculum to provide added job insurance for the trainee. Training programs developed under such conditions might, it is believed, be heavily loaded with courses of no useful relationship to the technician's job and therefore be wasteful in time and money for both the trainee and the training institution.

JUNIOR COLLEGE TRAINING PROGRAMS

Information concerning junior college training curriculum for electronics and chemical technicians is reported in the pages that follow.

Opinions of Junior College Electronics Instructors

Questionnaires were submitted to instructors of electronics courses in the various California junior colleges. Responses were received from 38 electronics instructors who represented 21 colleges. Information regarding the viewpoints and attitudes of these instructors, on a subject-matter basis, was gathered by means of the questionnaires and is presented in the following summary and analysis.

Adequacy of high school preparation. The majority of the instructors were of the opinion that high school students entering electronics

programs were inadequately prepared. In order of frequency of response, inadequate preparation in mathematics was cited as the greatest handicap; next, inadequate preparation in both mathematics and science; third, inadequate training in science alone; and fourth, poor preparation in the field of written expression.

Perhaps these attitudes reflect one of the basic differences in types of training offered by junior colleges and by the service schools. Service schools build the basic mathematics and science background theory into their curriculums. Junior colleges build technical programs complementing formal course work in mathematics and science. As pointed out several times previously in this report, the validity of such procedures cannot be determined with certainty until the work of the technician is more clearly delineated.

Basic junior college training problems. The most frequently mentioned problems associated with technician-training programs in junior colleges were those involving the lack of time, money, and qualified staff personnel. Insufficient exchange of information necessary for adequately presenting industrial requirements to schools and for apprising industry of junior college training plans was cited as constituting the next most serious problem. Inadequacies in screening and selection, as well as in student preparation, were also frequently mentioned. The development of better methods for selecting students who apply for electronics courses appears to be one of the most difficult problems confronting junior colleges. Many instructors believe that their instruction is seriously impaired by the enrollment of low-ability students in such courses. This problem is discussed more fully later in this report.

Determining student selection criteria. Aptitude and interest were most frequently mentioned by instructors as factors that facilitate the selection of students for electronics courses. Other instructors, in order of frequency, cited level of mathematics preparation, intelligence and earned grades, personality factors, and level of science preparation as the most desirable means of determining student selection. Thus there would appear to be little agreement among instructors as to the most acceptable selection criteria.

Essential mathematics and science training levels. Basic algebra was cited as the branch of mathematics most essential to the technician. This finding was followed, in order of frequency, by recommendations for mathematics training from basics through trigonometry, and then by recommendations for training in basic mathematics only. Also men-

tioned, though less frequently, were courses in advanced algebra, calculus, plane geometry, analytic geometry, and Boolean algebra.

Physics was most frequently mentioned as the essential science. This was followed, in order of frequency, by choices for chemistry, electronics, general science, and biology.

One of the striking factors noted in the responses of the junior college instructors was the lack of agreement as to what constitutes adequate mathematics and science training for the technician. Perhaps this lack of agreement reflects again the lack of a clear-cut definition of the technician—who he is and what he does.

Mathematics and science teaching methods. Approximately 50 per cent of the electronics instructors responding to the questionnaire favored the teaching of mathematics and science in special courses for technicians. Approximately 30 per cent favored training for technicians in regular mathematics and science courses. Only 14 per cent expressed a preference for the Navy "craftsman" method, i.e., incorporating mathematics and science in electronics courses as the need arises.

Some attention to the objectives of mathematics and science courses would appear necessary to ensure that technicians from the various schools are somewhat uniformly equipped in terms of immediate usable skills.

Appraisal of Chemical Technician Training Programs

Since apparently no junior college in California had in operation a formal program for training chemical technicians, it was decided to interview personally representatives of chemistry departments of junior colleges in the San Francisco Bay Area and in the Sacramento area. Contacting these representatives was thought to be particularly pertinent in view of the fact that considerable interest in such programs had been expressed by chemical companies. In all, chemistry instructors in 12 junior colleges were requested to express their concepts regarding the chemical technician and his training. During the interviews the chemistry instructors signified what they regarded as necessary characteristics of the chemical technician and desirable levels of his training, especially the mathematics and science requirements of that training.

A summary of the interview findings follows.

Chemical technician training as a function of the junior college. Opinion appeared equally divided on the question of whether or not junior colleges should offer a special curriculum for chemical techni-

cians. The current absence of such a special program was attributed either to (1) lack of demand by industry or by students; or to (2) failure to recognize a program of this type as a proper educational function of the junior college.

Qualities of a chemical technician as perceived by instructors. Most chemistry instructors considered an intelligence level of merely "average" as essential to the chemical technician. Those who expressed this view stated that chemical technology is not challenging enough for the "bright" individual and that the more intelligent person should be guided toward advanced work and a professional degree in chemistry.

The next most commonly expressed view portrayed the chemical technician as one who had no pronounced ambitions, either for advancement on the job or for higher education. This viewpoint is perhaps a valid one in the light of the chemical technician's limited promotional opportunities, discussed in Chapter III of this report. The present situation in industry may exist, however, because better-qualified technicians are not available. Perhaps the chemical industry has been compelled to depend on "flunk-outs" for their technicians. If abler chemical technicians were generally available, the industry might readily place capable technicians in positions of greater challenge. Representatives of one company, in fact, expressed a preference for Navy-trained electronics technicians, apparently because their purported higher-ability levels enable them to learn rapidly, to work independently and, generally, to develop into excellent chemical technicians.

Other trainee characteristics frequently mentioned by the chemistry instructors as desirable included good work habits, dependability, interest and initiative, ability to get along with others, and good manual dexterity.

All points of view considered, the stereotype of the chemical technician as pictured by the chemistry instructors is not particularly flattering to the technician and is not one that is likely to encourage an able student to choose with enthusiasm the profession of chemical technician as his life's work.

Academic preparation. None of the junior college chemistry instructors professed to regard mathematical skills, beyond those taught in courses from the level of basics through the level of trigonometry, as essential to the chemical technician in his work. A large per cent, in fact, considered one or two years of algebra sufficient for the types of learning and work experiences demanded of this type of technician.

Many of the instructors recommended a basic course in physics and suggested that additional courses in physics would be "nice but not

necessary." A basic course in electronics was also proposed by several of the instructors because, in their opinion, it would give the students a better understanding of the many electronic instruments used in chemical technology.

The emphasis in science preparation, of course, was in chemistry. The majority of instructors would expect the chemical technician to include basic, organic, qualitative, and quantitative chemistry in his program. Some instructors saw no reason for the technician's training to vary from that received by other chemistry students; others contended that the nature of the technician's work warranted a different training approach. Those favoring separate course work for the chemical technician stated that his training should differ from that offered the transfer student to permit greater emphasis on the practical aspects and less on theory. This latter point of view is one that has been strongly expressed by representatives of companies employing chemical technicians.

Morale factor in chemical technician training. A problem of morale became evident in almost all of the discussions with junior college personnel who were concerned with the course training of chemical technicians. This problem appeared to take its rise from a tendency on the part of both staff and students to regard the potential chemical technician as a person having only mediocre ability. He is often regarded as a student who just can't "cut the mustard" in a professional program. Those students, therefore, who withdraw from engineering programs to enroll in courses for technicians tend to view themselves—and to be regarded by others—as "flunk-outs." A number of educators have cautioned that these technical programs must not become or be considered catch-alls or, in Conant's words, "dumping grounds"[3] for students who are thought to be unable to complete other programs. Such negative attitudes serve to discourage many qualified students from undertaking technical training. The result to industry is the loss of a large number of potentially promising technicians.

The military services appear to have avoided problems of this kind in the electronics area. By restricting their programs to students of high academic ability, admission to service schools has become something to be desired. Acceptance for technician training appears to carry considerable prestige value for the serviceman.

Certain junior colleges are presently according more attention to the student-appeal factor in their technical program planning. Technician students in some institutions have been encouraged to establish clubs

[3] James Bryant Conant, in "Education for the Atomic Age." *Collier's Encyclopedia*, New York, 1959.

similar to those formed by engineering students and by students in other groups training for professional careers. Many junior colleges are increasing efforts to keep students better informed of the nature, value, and opportunities of technical education.

It is not yet possible to evaluate significantly the effects of these morale factors on technical education. Additional study in this area might well assist the junior colleges that are engaged in technical education to recruit more effectively the technical student and to take practical steps toward solving his training problems.

Chapter VI

SUMMARY OF FINDINGS AND CONCLUSIONS

This study was designed primarily to illustrate a technique for determining the critical mathematics and science requirements for two groups of technicians—electronics and chemical. However, the technician's identity in the ranks of industry, even within particular companies, could not be conclusively established from the available data. The exploratory nature of this study, therefore, should be recognized and its findings and implications interpreted somewhat tentatively. On the other hand, despite the difficulties encountered in defining sampled populations, the consistency of data collected from the various plants and the rather clear picture that emerged in analyzing these data suggest that certain findings may be widely applicable.

EFFECTIVENESS OF THE CRITICAL INCIDENT TECHNIQUE

Since one of the major purposes of this study was to demonstrate an approach to the problem, a comment regarding the use of the critical incident technique should be in order. The technicians involved in the study project submitted some usable reports of incidents; and, although the number of the reports was quite small, the technique appears to be a valuable one for obtaining information of this kind. However, it is recommended that, in future studies of a similar nature, this technique be used only in an interview situation, limited either to individuals or to small groups of not more than 10 persons, rather than by means of a questionnaire distributed throughout the plant. In this way responses could be clarified and assistance given to those having difficulty in completing the questionnaire. This recommendation is in keeping with the findings reported earlier by Flanagan. (See Chapter II, page 8.)

ARE MATHEMATICS AND SCIENCE SKILLS BEING UTILIZED?

The data gathered in this study would, with few exceptions, strongly support the conclusion that high-level mathematics and science skills are not used by electronics and chemical technicians in the performance of their jobs. The wide variety of educational backgrounds reported,

ranging from high school training through four years of college preparation, would indicate that the need for advanced formal training in mathematics and science is not crucial. The limited numbers of critical incidents reported and the elementary nature of the skills involved in the incidents would also indicate that high-level mathematics and science skills are not essential for satisfactory performance as a technician. Moreover, the opinions expressed by a large number of training directors tend to confirm these findings.

The findings of this study suggest that industries are not fully utilizing the skills of the men who are available to them. Many technicians have had mathematics and science course work extending far beyond that required for their job performance. Interestingly enough, a large proportion of the technicians are seeking to improve their skills through additional course work. Thus industry would seem obliged to consider seriously whether or not more efficient use can be made of the technical skills available.

It may be readily inferred from a study of hiring specifications written by various companies that industry, particuarly in the electronics field, is seeking personnel with much higher mathematics and science attainments than the positions actually demand. Although no data explaining this practice were gathered, it appears likely that the prescription of these skills is intended, partially, as a screening device. It may be reasoned that an applicant, having successfully completed higher mathematics and science courses, has demonstrated that he possesses a fair degree of intellectual ability. If such a hypothesis is correct, it would seem appropriate to consider the use of screening devices other than those involving technical skills—tests such as those that measure scholastic ability.

The foregoing is not offered to imply the absence of valid reasons for seeking manpower skills in excess of job requirements. It might be shown, for example, that technicians possessing advanced formal training are more adaptable to rapidly changing conditions in the technological fields. Whatever reasons exist, however, should be declared. An open differentiation in terms of skills actually needed and skills of potential usefulness might possibly dispel much of the confusion now evident in areas of technological curriculum planning. It might be appropriate to add that difficulties created by the lack of such differentiation are by no means unique to the technical field. They are also characteristic of many professional curriculums such as medicine, engineering, and psychology.

RELATED PROBLEM AREAS

A number of other problems worthy of consideration, not only for their relationship to study objectives but also because they affect the nature of technician training programs, were discerned during the collection of the data. These problems are identified and briefly discussed here with respect to their more challenging aspects and probable future effects on the development of technical education.

Who Is the Technician?

The first of these problems concerns the need to define the technician. As indicated in various sections of this report, no one seems to know who the technician is or exactly what he does or should do. Consequently, he is the subject of a broad variety of descriptions among industries and even within particular plants. Inability to define the technician clearly is reflected in the failure of various committees to agree on apprenticeship requirements for the relatively new occupation of industrial technician.

How can training programs be realistically established under such conditions? It appears that, even though many of the technicians are not highly trained, the mathematics and science skills they do possess are often not fully utilized. Would the task of the technician be materially altered should he be shown capable of functioning at higher than present levels? If so, then is it the job of the junior college to determine the level of skills to be possessed by its graduates? For example, should the level of mathematical skills be raised by prescribing calculus as a graduation requirement for all technical students, with the expectation that industry will find a way to use such skills? Should industry define the levels needed to perform the job and expect the training institutions to conform accordingly? Or is there some logical basis, apart from job requirement considerations, for specifying certain skills?

Without doubt, this problem must be approached co-operatively by industry and by training institutions. Certainly the work of the technician needs to be specified before meaningful training curriculums can be devised. One of the major reasons for the success of military technical training schools was traced by the study findings to the practice of accurately specifying the nature of the job to be done, thus making it possible to custom-build a curriculum.

The investigators are of the opinion that, for the most part, training curriculums in the junior colleges have not been developed from job descriptions of either the electronics or the chemical technician. Indeed,

as already indicated in this report, sufficient information has not been available to permit a basis for curriculum development in this manner. Rather, a need is expressed and then a course is added, purportedly to meet this need. Apparently very little attention has been devoted to curriculums for the chemical technician. For the most part, he is limited to a program of courses designed, typically, for the college transfer student. Thus the would-be chemical technician knows a limited amount of chemical theory but very little about laboratory technique, which is usually offered in upper-division courses. It may be worth while seriously to consider adopting for both groups of technicians a more integrated approach to training, such as the "craftsman" method of the Navy Class A electronics schools.

Junior College Selection Difficulties

A second problem concerns the selection of students for technical training. Probably a primary reason for the success of service schools lies in the practice of admitting only top-level students, academically, to classes in technical course work. Junior colleges, on the other hand, have done very little preselection. This was reported as one of the serious shortcomings of junior college programs by instructors of their electronics courses. Apparently the difficulty lies partly in the necessity to have at least an assured minimum enrollment before a class can be offered. The consequent admission of low-ability students to meet initial enrollment quotas was reported, therefore, as seriously lowering the level of instruction. Perhaps some degree of specialization among junior colleges is necessary in order to assure an adequate supply of academically able students for the technical curriculums.

Morale Among Chemical Technician Trainees

Problems of morale and status, particularly in regard to the training of the potential chemical technician, appear serious enough to warrant consideration. The practice of encouraging able students to transfer to four-year colleges and counseling those unable to earn transfer grades to become chemical technicians seems to prevail among the junior colleges covered in this survey. Consequently, courses tend to parallel university offerings. According to representatives from the chemical industry, this practice contributes to a condition in which a considerable number of employees are both disgruntled with their lot and poorly prepared for the laboratory requirements of their work. A tendency among instructors to down-grade the status of students majoring in chemical technology must surely have an effect upon the way these

students perceive themselves. In contrast, the electronics student is encouraged by his instructor's enthusiasm and perception of electronics education as a proper function of the junior college.

As it was borne out earlier in this report, chemical technology jobs appear to be in a "dead end" category. Opportunities for promotion are limited. Contrariwise, the situation appears decidedly more attractive for electronics technicians. Jobs for those in the latter group are seen to offer many opportunities for advancement, and college electronics training courses occupy a higher status, relatively, than do offerings in chemical technology. Differences between the two occupations in opportunity and status suggest potentially serious job-adjustment problems.

Inadequacy of Chemical Technician Training

Industrial representatives interviewed in this study said that there is a definite need for a limited number of chemical technician training programs. Before adequate programs in chemical technology can be developed, however, a reorientation in the attitudes of junior college chemistry instructors may be necessary. That these instructors should perceive thorough training in chemical technology as a legitimate obligation of the institution appears necessary when one considers the vocational objectives of two-year technical programs offered by junior colleges. It is certain that the graduates of any junior college program involving training in chemical technology must know laboratory techniques and be reasonably skilled in applying them. At the present time, persons with only two years of preparation in junior college chemistry are thought to be so lacking in laboratory skills that one chemical firm prefers electronics technicians from Navy schools to junior college chemistry graduates. This firm reports that the Navy school graduates know laboratory techniques quite well and can learn the chemical skills necessary for company operations within a relatively short time. Here again, there is a need for close working relationships between junior colleges and industry if realistic training programs are to be developed.

Career Guidance Deficiencies

A last point concerns the need for career guidance in technical fields. The satisfactions to be realized by the technician from work in electronics, as compared to those in chemical technology, appear of widely differing character. Such a comparison suggests the desirability of fully apprising students who are ambitious for job placement of

the limitations currently existing in many chemical companies with respect to on-the-job opportunities for the chemical technician. Also there appears to be a need for a greater amount of valid information concerning the importance and the roles of technical occupations in our American culture. Much of the current literature on this subject has been developed mainly for recruitment purposes and, as such, frequently lacks the objective detail that is required to portray technical opportunities (1) in clear perspective; and (2) in proper relationship with other fields of endeavor.

There is no conceivable reason for either the student or members of the school staff to regard entry into a technical area of study as other than "respectable" when the student's decision is motivated by an anticipation of greater personal satisfaction from the applied aspects of technology than from the theoretical aspects of engineering. Unfortunately, unbiased information of the type permitting counselors to assist students substantially in making enlightened choices among the technical occupations is not now generally available. Perhaps studies such as this one will stimulate future exploration for the additional information that is so greatly needed to assess and to improve this very important segment of the occupational world.

RICHMOND PLAN; RICHMOND; CALIFORNIA

The purpose of this report was to consolidate the experience and implications from the Richmond Plan into a recommended approach to planning physical facilities for a comprehensive secondary school. The Richmond Plan is an interdisciplinary approach to pre-technological education which has been in operation in 2 high schools since the fall of 1962. The Plan involves integrated study in English, mathematics, science, and pre-technical laboratory and is considered a third "educational track" or alternative to the traditional college prep or industrial arts curriculums. Facility recommendations are presented for space and equipment requirements, and the relationship of the Richmond Plan to the traditional comprehensive school is discussed. Schematic plans for an interdisciplinary comprehensive high school, a technology center, a family life center, a scientific center, and a large group instructional center are given. The concepts of interchange, input, output, focus of attention, withdrawal function, and vehicles of memory are discussed as they apply to facility planning. Background information on the Richmond Plan is also included. (EM)

INTRODUCTION

This report has been prepared for the Richmond Schools by Daniel, Mann, Johnson, & Mendenhall, architects, engineers and planners, for the purpose of consolidating the experience and implications derived from the Richmond Plan into a recommended approach to physical facilities in a comprehensive secondary school program.

Consultants contributing to the report are the School Planning Laboratory of the Stanford University School of Education; James D. MacConnell, Director.

The study has been financially assisted by a grant from Educational Facilities Laboratories, Inc. to the Richmond Schools. EFL has taken an interest in this program since 1963 in conjunction with its general interest in vocational and technical education. EFL represents one of the levels of interest in education, that of physical plant and equipment, of the Ford Foundation.

Material incorporated in this report is derived from material assistance and consultation from the Richmond School staff: Dr. James L. Merrihew, Superintendent; Dr. W. W. Snodgrass, Deputy Superintendent; Dr. Robert J. Griffin, Assistant Superintendent, Instruction; George F. Chambers, Supervisor, Industrial Arts.

Further invaluable assistance has been rendered by the Planning Project for the District, initiated under the auspices of the Cogswell Polytechnical College and continued by the Educational Facilities Laboratory. Serving on this Committee were William Plutte, Principal of De Anza High School; John Briscoe, Science, De Anza High School; Robert Craig, Pre-Tech, De Anza High School; F. Reginald Dunning, Pre-Tech, Harry Ells High School; Emmett O'Neil, Science, Harry Ells High School; and George Chambers, Coordinator.

PREFACE

The changes taking place in American Education today, and the even more dynamic changes that are appearing on the horizon, affect its housing to an extent that is stimulating educators, administrators and architects who feel a responsibility for better accommodating these curricular changes.

One objective of this project is to develop guidelines in the programming, planning and design of a special senior high school facility based on the Richmond Plan.

One of the most significant developments in contemporary education is the expanding utilization of new learning media, including the use of films, slides, tapes and miniaturized audio-visual equipment appropriate for individual instruction materials. The possibility of using these media as well as the encouraging of designing of new media equipment has real meaning for these educational facilities and buildings required for the Richmond Plan.

Another objective of this proposal is to highlight those facilities in which new and commonly used media are utilized for learning.

The majority of today's Secondary Schools seem to be constructed on the organization pattern of teaching 25-30 students in a group, under the tutorage of one teacher.

Current needs and innovations are not being reflected in current, as well as anticipated school buildings.

A third objective is to identify trends and anticipated needs in the utilization of media that will affect future school facility needs as outlined by the Richmond Plan.

As educators reflect on their past successes and failures in planning curriculum and facilities to accommodate these programs there is often a desire to profit from these experiences and build upon them. This in essence is the philosophy expressed in the Richmond Plan which exhibits a keen desire to better educate a group of students who have demonstrated achievement under a quite different organization pattern. It is hoped that these achievements demonstrated to date can be accellerated as tailored facilities are planned for, and constructed.

James D. MacConnell
Professor of Education & Director
School Planning Laboratory
Stanford University

SUMMARY

The Richmond Plan, a "third track" team-teaching pre-technology program for 11th and 12th grade high school boys, has been in operation in two high schools, De Anza and Harry Ells and has produced excellent results.

The plan has succeeded in motivating "average learners" who were having difficulty in traditional college prep curriculums and has graduated two classes of technicians prepared for advancement in technological fields either in industry or in technical schools or colleges.

The course is essentially an extension of a science curriculum which integrates the areas of mathematics and English as reinforcement to form a total educational experience.

The physical core of the plan is the Pre-Tech Laboratory, an area where students may explore physical principals by constructing practical examples demonstrating these principals. By necessity the program to date has had to use facilities borrowed from the industrial arts department for this purpose. These areas were not planned with any such interdisciplinary activity in mind and consequently do not provide the best facilities for such an integrated program.

The two years experience with the program to date has convinced the Planning Committee of the validity of planning a distinct Pre-Tech Laboratory complex which will reflect and serve the interdisciplinary nature of the plan. Such a facility would have value not only to the program itself, but to other departments as well.

This facility could be integrated in a comprehensive high school and planned so that its activities would include courses for girls as well as boys, such as courses relating to homemaking and foods, cosmetology, and other areas where women technicians are in demand.

In addition, as the number of high schools in the Districts increases, consideration should be given to a Pre-Tech Center serving many schools. This would permit expenditure in space and equipment which could not be justified in a single school.

Facilities planned for this purpose should have the quality and atmosphere of a modern industrial research and development center. Equipment and furnishings should likewise be of industrial quality. The facility should give first-rate status to the pre-tech program as clearly divorced from the traditional industrial arts track.

However, the strongest implication of the success of the Richmond Plan is that this application of interdisciplinary team teaching, combined with a technically oriented educational program and flexible plant facilities, leads to a reconsideration of the entire secondary school plant. Guide lines for a school which will implement this program are developed in this report.

THE RICHMOND PLAN

A. Background

The pre-technology program, which has become known as the Richmond Plan, was introduced as a pilot project at De Anza and Harry Ells High Schools in the Richmond Union High School District in the Fall of 1962, and is being expanded to the other secondary schools in the District.

The plan is the culmination of a series of study projects sponsored by the Richmond City Schools and the Cogswell Polytechnical College with the assistance of a grant from the Rosenberg Foundation of San Francisco, with later extended assistance by the Educational Facilities Laboratory.

B. Objectives

The objectives of the program are two fold:

1. To provide training which will prepare students for advancement in technological fields as technicians.

2. To provide motivation for "average learners" not eligible for or not thinking about university training.

Mr. Claude Segre, writing in the Wall Street Journal, states:

> "Educators here see this approach as a possible answer to two closely related national problems -- widespread unemployment among unskilled teenagers and a shortage of skilled technicians."

The objective is to create a "third track", an alternative to the traditional college prep or industrial arts curriculums. The plan is intended to avoid the pitfalls of many vocational tracks which concentrate on skills which often become technologically obsolete. It is also intended to give status to the program as an extension of physics and engineering and to avoid stigma of "second class citizenship" often associated with industrial arts.

C. Curriculum

"The plan is an interdisciplinary enterprise involving close articulation between subject matter content in English, algebra-trig, physics-chemistry and tech-lab. The teachers participating in the program are members of an interdisciplinary instructional team whose every activity in the classroom is also closely articulated with the activities of all other members of the team. Innovations to bring about the highest possible learner motivations are in constant use. Revisions of techniques and content are also being evaluated, developed and applied to the learning situation."

Thus, the De Anza team has described its activities to the Planning Committee.

The technical laboratory, by definition and function, is a testing area which illustrates the theories and principles taught in traditional physics and chemistry classroom presentation. It is not a duplication of the traditional scientific experiments nor is it skills course. The success of the tech-lab is developed through "support areas" in close proximity to the activity area. The tech-lab is in effect an applied science and mathematics laboratory providing facilities where demonstration apparatus, large scale "pilot plant" applications of scientific principles and studies in the nature of materials, mechanical systems and electricity may be conducted. The students are encouraged to demonstrate in greater depth the concepts covered in physics, chemistry and mathematics.

A simple example is study of the inclined plane. The tech-lab course would build the inclined plane. The physics class and the math class would develop the problems to be studied and their solutions. The English class would be involved with the write-up and documentation of all experiments and conclusions to be drawn from the exercises.

Another example quoted in the Wall Street Journal:

> "In a Physics class, for example, tech pupils study the laws of gravity and motion by observing pendulums which they built themselves in the lab. In Math they develop the equations and formulas which describe a pendulum's movements. And in English they write compositions and give oral reports on their lab reports."

The study of sound is practically related to the phonetic alphabet as well as to engine mufflers. The study of speech is analyzed by the use of oscilloscopes, with well prepared and well delivered short talks by the students as primary end requirements.

When a teacher needs new demonstration equipment, a new application or a new instructional system he is free to engineer it. If it is new he will submit it to the staff for program-wide screening. After the proposal has been accepted by the instructional staff, it becomes a common problem for all members to add details for articulation.

D. Achievements

To quote De Anza's principal Plutte: "When we pick these students we're not even sure if they'll graduate from high school."

Yet in the two years of operation of the plan there have been only 3 dropouts from the group of 60 students in the program.

Further there were 20 honor students at De Anza alone in four (4) semesters. To quote principal Plutte: "during the first year of the plan, eleven of the thirty boys made the honor roll, and I'll bet it's the first time for all of them."

Since this report is written less than one semester after the first graduating classes, it is difficult to make any long-range evaluation of results.

However, a representative graduating class, from Harry Ells School, showed that the first Richmond Plan graduates were distributed as follows in the Fall:

One (1)	-	Armed Forces.
Fourteen (14)	-	Junior College.
Three (3)	-	Polytechnic College.
Two (2)	-	In Universities.
Five (5)	-	Technical Employment.
Three (3)	-	Non-Technical Employment.
One (1)	-	Unemployed.

Students enrolled in schools are enrolled in the following programs:

Four(4)	-	Electronics.
Three (3)	-	Architecture.
Four (4)	-	Business School.
One (1)	-	Chemical Technology.
Six (6)	-	Engineering.
One (1)	-	Agriculture.

The results so far indicate an outstanding success in providing motivation to the Richmond Plan students and in developing students and citizens adaptable to today's social and economics needs.

The District is maintaining contact with these graduates and will make periodic evaluation of the results in order to guide the future course of the plan.

E. Method of Operation

There are slight differences in the method of operation of the Richmond Plan as applied in the two schools to which it has been longest applied. Plans of these schools and class schedules are illustrated for reference.

1. De Anza High School

The physical arrangement at De Anza High School lends itself well to adaptation for the program.

As shown on the illustrated plan, the school's industrial arts shops are located in the same building as the Science Rooms. By appropriating an end of the auto shop as a project area, and occasional borrowing of space and its equipment from the metal and wood shops, something approximating a pre-tech central facility has been created as far as this school is concerned.

The dynamics of the program are such that when all of these spaces are available they are frequently all used at one time by the pre-tech group.

The small classroom adjoining the tech-lab is of considerable value to the program in permitting small group instruction and individual desk space for report annotation and preparation and reference study.

The conduct of the program at De Anza has been very self-identified, almost approaching a school-within-a-school. The boys have blazers with a "tech" insignia. Their class stays together as a group for most subjects.

2. Harry Ells High School

The facilities at the Harry Ells High School are not so fortunately located as those at De Anza and whether for this reason or others, the program does not have the same intense identity. This, however, is merely a matter of degree, as objectives, curriculum procedures and results are identical.

In the non-tech classes at Harry Ells, the tech students are more dispersed.

The tech-lab subjects at Ells are taught in the metal shop. This is a relatively spacious building and allows for special project construction and display which is distinctly related to the pre-tech program. Otherwise, classes are taught in conventional classrooms throughout the campus.

3. Other Schools

The program is presently being introduced in other high schools in the District. There has been little change made in physical plant. However, in the two new high schools being planned there is a sizeable space set aside in the Industrial Arts area for the pre-tech lab.

PROJECT FLOW CHART

RICHMOND PLAN

De ANZA HIGH SCHOOL
Pre-Tech Class Schedule 1964-65

11th Grade

Period	Subject	Teacher	Room
1	Physical Education	Mr. Gruess

HARRY ELLS HIGH SCHOOL

RECOMMENDATIONS - CURRENT PROGRAM

The recommendations developed herein are based upon the minutes and reports of the Pre-Tech Facilities Planning Project, consisting of interested staff in the Richmond Schools and supported by an E. F. L. grant. They are based upon extending the present program into new and existing comprehensive high schools.

A. Space Requirements

1. Machinery Laboratory

The pre-tech lab functions as an extension of the Physics Lab where students may explore to greater depth those concepts covered in physics, chemistry and mathematics. Equipment usage andskills are learned on industrial type equipment rather than small unrelated laboratory type objects.

The machinery laboratory portion of the Pre-Tech Lab. contains areas for working in metal, wood and sheetmetal. These may or may not be separated shop areas.

2. Electronics or Systems Laboratory

This area, suitable for radio and television projects and for electronic study and testing may also contain hydraulic and fluid systems equipment. It would be desirable for this area to be sound isolated for audio scope use and electrically shielded as with copper screen, particularly from arc-welding equipment.

3. Science Laboratory

The science lab. should provide for basic demonstrations in Physics and Chemistry, with adequate space for material testing. It would be desirable for this area to be located close to or connected with other science areas.

4. Mathematics and English

Although the same type of space is required for instruction and practice in mathematics and English it is possible that conflicts in scheduling would make it desirable to have two stations for these purposes.

4. Mathematics & English (Continued)

The combination of mathematics with drafting and graphics appears practical. In effect this would lead to two areas, one for drafting tables and the other a lecture style space; spaces can be used interchangeably for all technical communications purposes.

5. Projects Area

The Projects Area, called by the committee by various titles, unifies the Pre-Tech Lab and is the working demonstration area where final projects are developed. This requires good access to material storage, delivery and outside yard area. It would be desirable to dramatize and emphasize the pre-tech program by relating this area to a display area in such a way that other students may "watch the projects grow" and remain informed of the pre-tech activities.

6. Library, Offices and Other Areas

Since team-teaching is of the essence of the pre-tech program it is desirable to have a meeting area large enough to accommodate the staff. This could probably double as a reference library.

Good washing facilities will be required and student material storage.

7. General

Visual supervision between areas should be provided as much as possible. Science and Communications areas should be windowless for audio-visual and light experiment reasons. Working areas where tools are used extensively should have wood-block floors. Some earth floor should be available in the projects area and the outdoor area.

However, carpeting and furniture designed for the real need of pre-tech students should be employed in the communications area, library and circulation areas. A well designed color relationship should be developed; the overall atmosphere similar to that of modern industrial technical laboratories.

B. Equipment Requirements

1. Machinery Laboratory

General machinery and equipment for metal and woodworking are required, mostly of industrial type. The quantity of lathes, sanders, shapers, etc. can be less than in specialized vocational shops since projects are more varied and machinery training routines less intensive than in vocational tracks.

2. Electronic or Systems Laboratory

A variety of testing equipment such as oscilloscopes and capacitor testers, and A.C. and D.C. variable power supplies will be required. Optical and photographic equipment and a fluid power hydraulic unit are recommended for this facility.

3. Science Laboratory

A general science demonstration station should be augmented by scales and testing equipment for non-destructive and destructive material testing.

4. Mathematics, English and Communications

Audio-visual aids such as motion picture and overhead projectors and screens should be readily available. Drafting tables may be desirable in the mathematics area, and demonstration slide rules.

Generous use should be made of chalkboard, tackboard and display devices. Of most importance is the adaptation of such space to advanced audio-visual techniques.

5. Project Area

This area is conceived as a pilot bay where varieties of projects may be constructed. It should be well supplied with power and other utilities yet be capable of conversion to accommodate work on automobiles, engines, pendulums, structural frames by individuals and small groups.

6. Library and Office Equipment can be minimum, but should include reference shelves, which can be locked, a typewriter and duplicating machine. Audio-visual equipment should be in a locked storage area, but readily available.

C. Relationship To the Traditional Comprehensive School

The Planning Committee for the Richmond Schools Pre-Tech Project involved representatives of the various academic disciplines in a consultative capacity. Almost unanimously, they felt that the subjects of English, physics, mathematics for the track should have instructional areas as a part of a pre-tech complex. Particular emphasis was placed on the program being essentially an extension of physical science.

Further it was felt that the academic disciplines could utilize the pre-tech facilities themselves to augment their programs. Equipment and demonstration facilities in the tech-lab would enrich the programs in science, mathematics and English.

It was recommended that there should be a close physical relationship between the pre-tech facility and both science and industrial arts areas. As the program is broadened this relationship can be extended to homemaking, business education, and many other areas.

In order to use the teaching spaces required for the pre-tech activity in an efficient way with respect to a comprehensive school it appears inevitable that a flexible scheduling technique be employed. This would permit longer laboratory periods when required by more complicated projects and encourage the use of the space and equipment by college preparatory, pre-engineering and other related classes. Also, as a pre-tech student develops academic confidence and satisfactory work habits the flexibility of scheduling can permit him to pursue individualized projects related to his personal abilities to a greater degree than would be possible under a rigid schedule.

THE INTERDISCIPLINARY COMPREHENSIVE SECONDARY SCHOOL

A CONCEPT

Extending the principles of the Richmond Plan into new fields and exploiting the many new devices and new educational trends to the utmost has led the Stanford School Planning Laboratory, the Richmond Staff and the Architects to a broader concept of a framework for a secondary school plant.

A school building is essentially an enclosure drawn around the people and the process it is to contain. There was a time when the task of designing a school was more simple than it is today. The world is changing rapidly, and the effect of those changes inevitably touches the nature of the education in a school and influences the people who teach and learn there. In recent years, the pace has quickened. The forces influencing education have proliferated so rapidly that many old formulas and old designs are no longer adequate.

The facilities can enable the functioning of an interdisciplinary enterprise involving close articulation between subject-matter content in language arts (reading, writing, etc.) mathematics (arithmatic, new math, algebra-trig, etc.), chemistry and physics and the tech-labs (manual applications of concepts). Close proximity should increase the above articulation. Flexibility becomes the key word. Flexibility which enables program changes. Instantaneous, hourly, monthly, or yearly flexibility will enable the members of the interdisciplinary instructional team to meet the short attention span, the necessary varied teaching techniques, etc.

Education involves people and things. The design of space in the pre-tech centers and the educational tools and furnishings in that space must be based on a knowledge of how these students and the things of pre-tech education relate to each other, and how they best function together.

If not identical, at least general patterns do exist in the relationship of the pre-tech student, interdisciplinary instructional team, and the comprehensive school:

First, there are patterns of groupings and movements of the students and teachers within the school according to the age and/or mental advancement of the student.

Second, there are patterns of teaching-and-learning techniques related to group sizes.

Third, there are patterns of space requirements directly related to the logistics of group sizes and furnishings.

The way these patterns are formed distinctly affects the facilities and design of secondary school to serve the pre-tech program and to accommodate the teaching - learning process.

Tomorrow's pre-tech program in the secondary school will take into account the current concern to increase student-teacher contact and student contact with the physical or applied applications of knowledge.

The student will carry more responsibility for self-initiative, as he will when he goes into industry. His motivation toward accepting this responsibility will be encouraged by increased success of applied knowledge, small group instruction or lecture, and counsel.

As has been demonstrated at Richmond by re-adjustment of the grouping pattern, the interdisciplinary instructional team will meet with more students and still have time for small group instruction and preparation of lessons. With the help of electronic devices, television, tape decks, etc., expert teachers will be shared by more pre-tech students.

Rooms equipped with many special teaching aids, for one or more subjects, will be used in each center as a base of operations for teachers and students. Specialized teaching equipment and spaces as well as more specialized teachers from industry on a part-time basis are more distinctly required at the pre-tech centers.

A limited evaluation of the Richmond project suggested an indication of greater success when the students were brought together and when the students could identify with the program (and through the program with the school).

This pre-technical program has been adapted to the comprehensive senior high school program and has identified such areas as similar to that of modern industrial technical laboratories. These pre-technical programs demand constant re-evaluation and new equipment which places a greater demand upon (1) the flexibility of the facilities to expand and contract and (2) the flexibility of the facilities to enable the instructor at a moment's notice to move from a lab. to a lecture and back again in order to encourage learning of concepts through physical contact.

The program planning requires:

a. Machinery Lab. (metal, wood and sheetmetal). Concepts in these practical labs are covered in physics, chemistry and math.

b. Electronics or Systems Lab. (arc welding, audioscopes, fluid systems and electronics). Concepts from math, language arts and science).

c. Business Education Lab. (common experience in business and merchandising).

d. Family Life Lab. (home living, child care, etc.).

e. Science Lab. (chemistry and physics). Practical science problems. Use common science project storage and supply.

f. Mathematics and Language Arts (drafting and graphics). Use practical math experiences and applications.

g. Project Area. (work demonstration area).

h. Offices, Library and Conference (joint-use possible).

i. General Areas. (large group instructional area).

An interdisciplinary approach of subject areas with laboratory experiences will increase the effectiveness of the program. A lecture/lab. approach is suggested to meet the short attention span for learning and to apply immediately the concepts to the concrete applications.

For Example:

Electronics may include math, language arts, science, radio and television, hydraulics and vacuum, micro-wave, computers (from simple to complex), fabrications (shared with machine shop and metals), chemical fabrications (shared with chemistry), assemblies (including chassis), and electrical engineering and electronics instrumentation (shared with chemistry).

From this example an interdisciplinary approach is possible. However, it places upon the facilities certain requirements as to function and form that should be considered in the programming, planning and design of these special and unique facilities.

These considerations have led all of those concerned to a concept of relationships which may be used as guide lines to expand the application of "Richmond Plan" thinking, educational organization and achievement to the Comprehensive High School as a whole.

The plant gravitates about two courts or centers, the Technical Center and the Humanities Center. Each is flexible and interdisciplinary in character. Within the Technology Center science-based programs for boys and girls are developed around central project mock-up and display areas. The Humanities Center follows patterns already developed in team-teaching schools. The unique quality of this concept is the integration of the disciplines to achieve motivation such as that achieved by the Richmond Plan.

Following are suggested space relationships having as a central theme the Pre-Tech Lab.

SCHEMATIC PLANS

1. Interdisciplinary Comprehensive High School
2. The Technology Center.
3. Mechanical Center.
4. Business and Merchantile Center.
5. Family Life Center.
6. Scientific Center.
7. Large Group Instructional Center.
8. One "Class" at Work in the Mechanical Center.

INTERDISIPLINARY COMPREHENSIVE HIGH SCHOOL

TECHNOLOGY CENTER

MECHANICAL CENTER

BUSINESS AND MERCANTILE CENTER

* PARTITION WITH FLEXIBILITY AND VISIBILITY

FAMILY LIFE CENTER

★ PARTITION WITH FLEXIBILITY AND VISIBILITY

SCIENTIFIC CENTER

★ PARTITION WITH FLEXIBILITY AND VISIBILITY

LARGE GROUP INSTRUCTIONAL CENTER

(NEAR GIRLS' P.E. AND GYM AREA)

ONE "CLASS" AT WORK IN THE MECHANICAL CENTER AT A GIVEN MOMENT

A. In the Pre-Tech Lab. are recently completed project. In this illustration the subjects are welded space frames solving the problem of supporting a specific load.

B. In the Metal Shop two pairs of students are working on the current project. They are machining brass weights in the metric system. At the right two students are modifying their space frame project in the welding area.

C. In the Conference and Audio-Visual Room a group of students is reviewing a film on the mathematics of weights and measures. Between the Conference Room and the Metal Shop is a Stock Room where a student is ordering the brass stock required for his weights.

D. In a Counseling Room two students are reviewing their order lists and the calculations used with the Industrial Arts Instructor preparatory to ordering their material. They are separated from the Metal Shop by a glazed partition. In another room a group of four students is conferring on an assignment given to them to prepare a comparative chart of metric and English weights.

E. In the Library students are working at carrels. Some are calculating the sizes of their weights prior to ordering material. Others are completing their reports on the space frame project. Some are reviewing "memories" from A-V tapes.

F. The Drafting Space, and other spaces in the Center, are being used by students in other "classes" on a flexibly programmed project oriented basis.

COMMENTARY

Creative educational planning demands an enclosure of space that is enormously "flexible". As educational jargon has it: Space that permits any number of things to go on inside and yet prescribes little or nothing definite.

What are the things that space should do? Ideally, teaching space should make these things possible:

Interchange: The teacher and students should be able to reach a chalkboard quickly if they have something to explain. The teacher should be able to shift the children around in groups which change size and composition from one minute to the next. Certainly it should be possible for the teacher and students to shove the furniture aside so that the shape of the group will flow from what it is doing.

Input: The space should facilitate the flow of information from teacher to students. There should be plenty of room and materials at hand for the teacher to make the presentation as visual and vibrant as possible. This would mean not only convenient (perhaps moveable) chalkboards, but also that screens, projectors, models or whatever the teacher might need could be available without timewasting and interest-destroying delay and fiddlings. The space should also be arranged so that two or more teachers could teach as a team without getting in the way of each other or of the children.

Output: The space should permit "lots of output" on the part of the students. There should be ample "room for the kids to do things," to work with models or teaching devices, things on which to write, and places to hang things up for everyone else to see. There should also be provisions for other kinds of output than a student's producing for a teacher -- that is, space for a smaller group of students to tackle a problem by themselves.

Focus of Attention: This should be variable, not always pointed in one direction. If someone speaks from the back of the room, all of the students should be able to shift their attention quickly -- without straining their necks. Similarly, they should be easily able to form a purely individual focus for their own project, or a smaller group focus for discussion.

Withdrawal Function: The space should also allow a student to withdraw completely from the rest of the group's activity and retreat into his own inner world of thought and speculation. This could be accomplished in individual carrel spaces or even by simply providing each desk with a chalkboard surface so that the student could work on his own problem paying no attention to whatever else was going on around him.

Vehicles for Memory: The space should contain places, devices, and the capability of reminding the students of what went on previously, what they discovered the day before or last week. It should be possible to leave things on the chalkboard for long periods of time, to have models or displays constantly about -- anything and everything that would serve to recall to the student's mind his past knowledge and suggest its application to present problems.

This would demand that a building could be committed in part or as a whole to a single system of education and retain a great deal of character in the process, but that it could also be altered and committed to new demands on the pre-tech program when necessary. This means not only that its outward shape and size can be re-arranged and reorganized, too.

The building could thus be committed at any given moment, but the commitment could be altered. The obvious answer is to make it as flexible as possible. Can the building get out of the way of changes, but still enable, encourage, permit or nurture change?

CONCLUSIONS

There are many directions in which "third track" pre-technical training might go, and the program for such training defined by the Richmond Plan should be considered no more than a firm beginning. As many other vocational areas might be included within a similar third track as there are vocational offerings in junior colleges and other post high school institutions. Even the pre-tech training in engineering technology offered by the Richmond Plan will be modified from one high school to the next according to the perception of the administrators involved, existing programs, equipment and facilities available, and local opportunities for articulation with post high school vocational programs. How the Plan may be adapted, or what might be added to it to increase the number of opportunities offered by a third track requires further investigation. The applications of new teaching media in the program and the potential advantages of flexible computer scheduling merit study.

Perhaps the most insistent demand at present, however, and that which defines the next logical step to follow Richmond's pilot program, is that having to do with facilities. The Richmond experience has shown that the third track alternative to college-prep and craft skills training need not, and indeed should not, wait upon new facilities. It also demonstrates that a successful third track program can be instituted in existing facilities, and at a cost not significantly greater than that of existing programs. Still, the structure of the pre-tech program is somewhat conditioned by the structure in which it must be housed, and this represents a restriction that should somehow be removed. Whether a third track plan shares facilities with the college-prep track or the industrial arts track is not important so long as the equipment and spaces available are of a kind that allow the third track to retain its integrity as a distinct alternative. In practice, existing facilities do not fully provide this opportunity.

The Richmond Plan and any similar program will demand facilities that encourage the interdisciplinary functioning of the technical training idea. In general this means spaces must be available that are highly flexible in terms of possible use, and yet that adhere to the principle implicit in the idea of the "applications laboratory" as a focal point for supporting academic areas. The third track may be housed in restricted existing facilities, or in a new facility built to serve the technical training function exclusively. In all cases, the use and arrangement of the spaces will have to further the unique objectives of a career oriented program based on "applications" learning and interdisciplinary instruction.

The success of the Richmond Plan in its so far-limited application, utilizing adapted physical plant facilities, suggests that it would be valuable to pursue its expansion into other vocational and academic fields by means of educational and architectural planning studies in depth. The objective of such studies would be to create a model of an interdisciplinary comprehensive secondary school. General relationships involved in such a school are indicated in this project.

There is every evidence that further collaboration of educators, educational planners and architects could develop definitive concepts of a secondary school educational program and plant which would permit the motivation of Richmond Plan attitudes to permeate an entire school.

VT 004 913
Report to the Government of Libya on Vocational Training.

International Labour Organization, Geneva (Switzerland)
MF AVAILABLE IN VT-ERIC SET.
ILO-TAP-Libya-R-10
Pub Date - 66 47p.

*EDUCATIONAL NEEDS; *MANPOWER DEVELOPMENT; MANPOWER UTILIZATION; *VOCATIONAL EDUCATION; EDUCATIONAL FACILITIES; FACULTY; *DEVELOPING NATIONS; FEDERAL GOVERNMENT; FEDERAL PROGRAMS; NATIONAL SURVEYS; *PROGRAM PLANNING
LIBYA

The increased demand for skilled industrial manpower in Libya created a need for additional vocational education training facilities for youth and adults, an expanded training scheme for faculty and supervisory personnel, and greater coordination among administrative bodies responsible for training activities. Assistance in studying these needs was requested from the International Labor Office by the Government of Libya. An expert to advise and assist the Government was appointed and vocational training programs were studied. Some findings were: (1) The need for training is enormous, (2) New programs need to be established, and (3) Training facilities must be greatly increased and expanded. The principal recommendations were that (1) existing and future vocational training programs be coordinated, (2) pilot vocational training centers be used as the basis for program development, (3) inplant training programs be utilized, (4) adult basic education classes be established, and (5) a training program for vocational teachers be implemented. Annexure A: Fields of Competence of the Ministries with Vocational Training Programmes 38

Annexure B: Vocational Training Co-ordination Set-up 40

INTRODUCTION

A. Origin of Project

1. The increasing demand for skilled industrial manpower which has resulted from the accelerated tempo of economic activity in Libya has emphasised the need not only to extend the vocational training facilities at present available for young people and adults, but also to organise training schemes for instructors and supervisory personnel such as shop floor supervisors and foremen. Moreover, if maximum results are to be obtained from such efforts, an efficient system of co-ordination, designed to eliminate overlapping and duplication of functions among the administrative bodies responsible for training activities, is essential.

2. As part of its over-all programme to meet needs for trained manpower, the Government of Libya arranged for I.L.O. to provide the services of an expert, Mr. H.K.W. Baritsch of the Federal Republic of Germany, to act as vocational training adviser with the Under-Secretaries of Planning and Development, of Education, of Industry and of Labour and Social Affairs. This expert was on mission in Libya from August 1963 to January 1964.

3. In December 1963, the Government requested that an expert, if possible Mr. Baritsch himself, be provided for an additional two years for the purpose of advising and assisting the Executive Vocational Training Co-ordinating Committee and its secretariat, both of which operate under the direction of the Ministry of Planning and Development, on matters related to vocational training and its co-ordination. Mr. Baritsch was unable, because of previous commitments, to accept an extension of his mission and Mr. A. Figueroa-Colón of the United States of America was subsequently appointed by the I.L.O. to carry out the assignment. It lasted six months, from 13 March to 15 September 1965, and was carried out under the Expanded Programme of Technical Assistance.

4. The present report is concerned with the mission carried out by Mr. Figueroa-Colón.

B. Terms of Reference

5. The expert's terms of reference were:

General

(a) to advise and assist the Government of Libya on all matters concerning trade and industrial training, including the training of instructors, shop floor supervisors, and foremen;

(b) to assist the Government to co-ordinate vocational training activities with the Executive Vocational Training Co-ordinating Committee and its secretariat, both of which operate under the Ministry of Planning and Development;

(c) to act as Vocational Training Adviser and work in close harmony with the Under-Secretaries of State in the Ministries of Education, Industry, and Labour and Social Affairs.

Specific

(a) to advise on and recommend various vocational training programmes in the light of present and future manpower requirements;

(b) to advise on and recommend the development of entrance requirements for the various vocational training courses;

(c) to advise the appropriate ministries in the development of curriculum materials for various training programmes and the utilisation of modern instructional techniques including the use of audio-visual aids;

(d) to review vocational training facilities and programmes and advise on their development including, if appropriate, the financial aspects of such development;

(e) to advise on and recommend site locations for training facilities and requirements for physical plant layout;

(f) to train counterparts to continue with work upon conclusion of the project.

C. Acknowledgments

6. Grateful acknowledgment is made of the encouragement and courteous co-operation extended to the expert by the officials of the Government of Libya, both at the ministries and at the vocational training centres he visited, and by others with whom he came into contact during the course of his mission.

7. While it is impossible to record the names of all those from whom help was received, special mention should be made of the following:

Dr. A. Attiga, Under-Secretary of State, Ministry of Planning and Development;

Mr. I. Ghiblawi and Mr. A.B.A. El Sherif, Director-General and Assistant Director-General respectively of the Economic and Social Affairs Division of that Ministry;

Mr. B. Salama and Mr. M. Moghrabi, of the Social Affairs Planning Section of the Ministry, who were successively counterparts to the expert;

Mr. H. Shuweidi, Under-Secretary of State for Technical Affairs, Ministry of Education;

Mr. S.A. Salem, Secretary of Higher Committee for Vocational Industrial Education of that Ministry; and

Mr. M. El-Deen Said, Director of the Ministry's Technical and Clerical Training Centre (vocational trade school), at Sabratha.

PART I. TECHNICAL BACKGROUND

A. Vocational Training Co-ordination

8. Upon his arrival in the country, the Ministry of Planning and Development informed the expert of the Ministry's concern over the need for an improved system for co-ordinating the vocational training activities operated by various ministries, especially those being carried out by the Ministries of Education, of Industry, and of Labour and Social Affairs. Officials explained the difficulties which had arisen in assessing the structural framework of each Ministry, an action which had been undertaken in order to decide which Ministry should have final responsibility for the various vocational training schemes. They suggested that a study be made of the organisational structure of the ministries concerned, so as to determine the fields of competence of each Ministry in offering vocational training adequate to meet the acute shortage of skilled manpower from which Libya was currently suffering. The purpose was to prevent overlapping of activities and to ensure maximum results from the efforts of each Ministry.

B. Vocational Training Programmes in Operation

9. Details concerning steps taken by the expert to secure information on vocational training programmes in operation upon his arrival, and the results obtained, will be found in Part II.

PART II. WORK OF THE MISSION

A. Study of Vocational Training Programmes

10. In order to carry out the various assignments entrusted to him in accordance with his terms of reference, the expert proceeded to make a study of the vocational training programme then in operation in Libya. For this purpose he -

(a) drew up and sent a detailed questionnaire (see Appendix I) to the ministries concerned with training;

(b) discussed this questionnaire with the Under-Secretaries and Directors of Training of these ministries so as to obviate any misunderstanding as to the information requested by them;

(c) summarised the information supplied by the ministries in answer to the questionnaire, in order to present a clear picture of the vocational training activities being carried out at the time of his arrival (see Appendices II and III);

(d) examined contemplated vocational training programmes with a view to determining where duplication of effort might arise and to making projections of their future output in the light of the estimated manpower training requirements set out in the report on manpower prepared by Mr. Nair, I.L.O. manpower expert[1], and other documentation (see Appendix IV); and

(e) prepared a study of the proposed United Nations Special Fund project[2] in the field of vocational training to determine its potential contribution to meeting the country's requirements for skilled manpower for the purposes of its economic development.

---

[1] A Survey of Requirements of Professional Technical and Skilled Manpower in Libya, October 1964.

[2] This project was approved by the Governing Council of the Special Fund in January 1966.

B. Visits to Training Programmes and Centres

11. In order to obtain factual information concerning the operation of the training programme which would enable him to offer recommendations for improvement, the expert visited the various programmes in operation under the Ministry of Industry at Tripoli, Benghazi, Derna, Misurata, and Homs; the Education Ministry's two technical and clerical training centres (vocational trade schools) at Sabratha and Benghazi, the civilian personnel training programme conducted at the Wheelus Air Base at Tripoli under the auspices of the United States Government, and the Islamic School of Arts and Crafts.

C. Suggestions for Improvement of Existing Programmes

12. During these visits the expert was accompanied by his counterpart and by a representative of the Ministry concerned. He discussed his observations with this representative and offered suggestions for the improvement of the training programmes involved.

13. As a result of the above visits, the expert visited the Ministries concerned and made a number of suggestions for the improvement of their programmes. A written report on a visit to the Sabratha technical and clerical training centre (vocational trade school) was also prepared and discussed with the appropriate officials of the Ministry of Planning and Development and the Ministry of Education.

D. Setting "Governing Principles"

14. During the visits to the various training centres the expert observed that the training schemes in operation were not sufficient to meet the acute shortage of skilled workers. He advised that the small number of existing programmes should continue to operate subject to their improvement in accordance with the recommendations he offered and provided they followed a set of "Governing Principles" prepared to this effect and which should be observed in the operation of all possible schemes to meet training needs. It is on the basis of these "Governing Principles" that the Vocational Training Co-ordination Executive Committee will establish regulations which will standardise procedures and thus avoid duplication of effort in the vocational training programmes conducted by the various ministries in accordance with the fields of competence which were to be approved by the V.T.C.E.C. at a meeting to be held after the expert's departure.

E. Co-ordination of Vocational Training Programmes

15. After preparing the set of "Governing Principles", the expert gave much of his time to the question of co-ordinating existing vocational training programmes.

16. A meeting of the Joint Planning Committee, at the level of the Under-Secretaries of State of ministries with training programmes, was held on 6 September 1965, under the chairmanship of the Minister of Planning and Development, to consider the recommendations which the expert had presented on 5 May 1965 concerning:

(a) the delineation of the fields of competence of the ministries with vocational training programmes;

(b) the organisation of the Vocational Training Co-ordination Executive Committee; and

(c) the establishment of a Vocational Training Co-ordination Executive Committee Secretariat to be attached to the Ministry of Planning and Development.

17. After some discussion, the expert's recommendations were approved (see Appendix V).

18. A meeting of the Vocational Training Co-ordination Executive Committee composed of the Directors of Training of the ministries concerned was to be held after the expert's departure to take action on the approval of the "Governing Principles" and on the organisation of the Committee Secretariat, which will have responsibility for the implementation of the decisions taken by the Committee.

F. Preparation of Technical Papers

19. In connection with the suggestions made for improvement of the vocational training programmes being carried out under the various ministries, the expert prepared several technical papers with a view to clarifying certain aspects of vocational education and training, confusion about which had contributed much to duplication of effort in the field of training. Copies of these papers were given to the ministries, whose officials expressed their satisfaction with this assistance.

G. Advice on Proposed Bilateral Training Programmes

20. At the request of the Under-Secretary of Planning and Development, the expert undertook a study of various vocational training programmes which it was proposed to establish under

bilateral assistance schemes. He recommended that the Government should accept the following:

(a) an accelerated training programme in Tripoli and Misura for the training of diesel mechanics, clerks specialised in materials control, inventory procedures and warehousing, shop supervisors. This programme will be carried out with the assistance of the American Friends of the Middle East, Inc.:

(b) an accelerated training programme in Sabratha and Benghazi for the training of electricians and electro-mechanics, with the assistance of the French Government;

(c) a long-term training programme for the training of young workers in auto-mechanics, machine-shop, electricity and welding in Derna and Misurata. The training centre in Derna will be organised and operated with the assistance of the Government of the Federal Republic of Germany.[1]

H. Activity Proposals submitted to Ministries

21. In an attempt to broaden existing vocational training activities, the expert prepared and submitted to the Ministry of Education for study proposals to establish a vocational diversified occupations programme[2] and a teacher education programme for vocational education teachers and instructors. The preparation of both programmes was solicited by the Under-Secretary for Education.

22. A proposal for an apprenticeship programme was sent to the Ministry of Labour and Social Affairs to serve as a basis for the establishment of the apprenticeship programme contemplated under the proposed Special Fund project.

---

[1] Details of programmes (a) and (c) are given in Appendix IV.

[2] This type of programme provides on-the-job training for one half of the day and related and general classes for the other half.

PART III. CONCLUSIONS AND RECOMMENDATIONS

A. Need for More Vocational Training

23. The need for training Libyans to meet the acute shortage of skilled manpower is enormous. Training facilities must be greatly increased and extended, both qualitatively and quantitatively, if the economic development plan of the country is to be successfully carried through. In the present situation every effort, great or small, in the public or in the private sector, in the capital city or in smaller towns, is vital to the economic expansion of Libya. More vocational training programmes should be organised so as to obviate the necessity to import skilled manpower, which came formerly from Italy and is now brought in from Morocco.

24. The new programmes to be establlished should be such as to encourage young and adult workers to prepare themselves to obtain employment and to improve the skills they already possess, consonant with the new developments in industry. It is imperative to establish training programmes which can be geared to the immediate needs of industry and which will provide a reservoir for present and future needs in meeting the demands of the new technology and the rapid expansion of the economy created by the development of the oil industry and other industries following in its wake. However, great care should be taken to avoid duplication of effort in the proliferation of training programmes within ministries.

B. Co-ordination of Vocational Training Programmes

25. Duplication of effort can be avoided by the establishment of the Vocational Training Co-ordination Executive Committee Secretariat within the Ministry of Planning and Development as approved by the Joint Planning Committee on 6 September 1965. The major responsibilities of this autonomous body would be the co-ordination of the various vocational training programmes in operation and the setting of norms and principles governing the establishment of new vocational training schemes.

26. It is recommended that a meeting of the Vocational Training Co-ordination Executive Committee be held as soon as possible in order to organise its Secretariat, which will take action on the determination of the "Governing Principles" designed to standardise procedures in the operation of vocational training schemes and to maintain within the approved limits the respective fields of competence of the ministries with vocational training programmes and thus to avoid overlapping and duplication of effort. This will help to ensure the efficient implementation both of existing vocational training programmes and of those to be organised in the future.

C. Pilot Training Centres Envisaged under the United Nations Special Fund Project

27. It is recommended that the pilot vocational training centres envisaged for Tripoli and Benghazi under the project which has been approved by the United Nations Special Fund form the basis for the establishment of a sound, comprehensive vocational training scheme which, in addition to being recognised by industry, would attract the public's attention to the merits of such training. A scheme co-ordinated by the Secretariat, assisted by the Headquarters element of the Special Fund project, and including the new Directorate of Training envisaged by the project, would be an appropriate way of making modern training available to larger geographical areas, thus bringing together the resources of all the ministries concerned for the purpose of meeting the shortage of skilled labour in the country as a whole.

D. In-Plant Training Programme

28. Industry has an important role to play in skill development. Some industries, especially the oil industry, have their own in-plant training programmes but they are not sufficient to meet the demand for skilled manpower. Besides, many industrial plants do not have adequate facilities or the instructional staff to provide the training.

29. It is recommended that the Government should start a vigorous campaign to encourage labour and management to accept an appropriate share of the responsibility for training their workers, and should make provision for incentives to be offered to industry so that it may modernise and reorganise production shops and thus enable the Government to have at its disposal more adequate training stations for its on-the-job training programmes.

30. Specialised training courses in industry could be organised with financial or technical aid from the Government so as to promote this kind of training. This could be a significant step in closing the gap between industry's need for training and the nation's capacity to provide the training. In this work the assistance of the In-Plant Training Expert envisaged under the Special Fund Project would be most valuable.

31. In developing the in-plant training programme, care should be taken to ensure that on-the-job training is not employed as a means of obtaining cheap labour.

32. It is recommended that:

(a) trainees be placed under the direction and supervision of competent trainers, whose main duty will be to train

them in all the jobs specified in a schedule which should form part of the training agreement signed by the employer and the trainees concerned;

(b) trainees be given training only in those jobs which are included in the schedule;

(c) an individual progress record of each trainee be kept at the training station to ensure that training is being offered only as stated in the agreement;

(d) due consideration be given to the ratio of trainees to regularly-employed workers in any occupational field; the number of trainees in a given firm providing training should not exceed 25 per cent. of the total working force;

(e) steps be taken to organise, as soon as possible, the related instruction required by trainees;

(f) short-term instructor training courses be offered for the initial or refresher training of trainers, teachers of related theory, supervisors or co-ordinators of the in-plant training programme;

(g) trainees be visited at their training stations by the supervisors or co-ordinators at least once a week, to check on their progress;

(h) a study be made of the firms providing training to see that they have sufficient equipment and facilities to offer the required training;

(i) a formal system of placement and follow-up be established as soon as possible.

E. Need for Basic Education for Adults

33. In order to restore the hard-core unemployed to full productive capacity, it is considered essential that the Government create training courses tailored to their special needs in the context of the job market which they face. Basic education is needed to provide instruction for adults who are unable to read and write or who have not completed the equivalent of an elementary education, with a view to increasing their opportunities of training for productive and profitable employment. Widespread low levels of literacy have already created serious obstacles in imparting instruction, especially that provided by on-the-job training.

34. It is recommended that the Government start a broad literacy programme for adult workers by offering evening classes in reading, writing, and elementary arithmetic. This would make it possible for the unemployed and many employed workers to absorb occupational training for the job openings available to them. The ability of the adult worker to hold a job, or to find a new one when he becomes unemployed, would be greatly improved if he could learn to read, write, and add.

F. Up-grading of Workers

35. Modern technology requires that workers be trained in the new, advanced techniques and industrial processes if they are to keep their jobs and fill positions carrying greater responsibility. This training can be offered in evening classes for workers, which at present are not available to Libyan workers.

36. It is recommended that all possible training (and where necessary, educational) facilities be used in order to provide this much-needed training.

37. It is recommended also that the Government draw up a scheme under which industry would provide for workers to take additional technical training; for example, by offering them time off with pay to attend instruction, reimbursement of fees, travelling expenses, etc.

G. Need for a Functional Vocational Education Programme

38. A vocational and technical education programme, if it is to be effective and help to provide the skilled manpower required to improve the economy of the country, should operate under basic principles which will assist the schools to make a substantial contribution towards achieving the desired objectives. Because of their low output, the country's two technical and clerical training centres (vocational trade schools), as they operate at present, are not making a significant contribution to the reduction of the acute shortage of trained personnel for industry and for various government activities.

39. It is therefore recommended that action be taken on the recommendations which follow for the improvement of the vocational and technical education programme, so that these schools may have a greater share in the training of young workers for the nation.

40. It is recommended that the Sabratha technical and clerical training centre (vocational trade school) be transferred to Tripoli in order that its facilities may be used to capacity

by organising afternoon and evening classes for adult workers, supplementary extension classes for the trainees of the on-the-job training programme being conducted by the Ministry of Industry, and, pending development of the necessary facilities for this training under the Special Fund project, some accelerated training.

41. It is recommended that, in order to eliminate the erroneous concept that it is undignified to work with one's hands and also to make the community aware of the social and economic contribution which the vocational trade schools can make to the attainment of a fuller life, a publicity programme be established. This programme should make use of all communications media available and be designed to foster the idea that an individual may obtain as much benefit from the skilled manual occupations as from the clerical and administrative work which is more sought after.

42. It is essential that the Government be in a position to evaluate results obtained from the effort put into vocational education, bearing in mind the present and future needs of the country.

43. It is recommended therefore that a thorough survey be made of all graduates and drop-outs of the vocational trade schools during the last five years. This "follow-up" of the product of these schools will make it possible to study the difficulties which impede the progress of school graduates and drop-outs in their new posts and thus provide information for the revision of the curricula in accordance with the requirements of industry for skilled manpower and the needs of young workers.

44. It is recommended that there be established a series of advisory committees representing Government, employers and workers which would examine and advise on the various courses in the vocational trade schools. Such committees could also advise on the selection of pupils, assist in the placement of graduates and in the selection of equipment and supplies, and arrange for teachers and students to make periodic visits to industry so as to become aware of the criteria which the school instruction should meet. The functions of the committees would include the provision of advice and guidance aimed at improving and maintaining the quality of vocational education.

45. It is recommended that a thorough study of curricula be made to determine the texts and reference materials essential for the acquisition of the minimum knowledge required in each trade area and that these materials be translated into and printed in Arabic. This practice should be continued until such time as ways can be found to make it possible for teachers and instructors to prepare their own materials and thus avoid the time-consuming method of "dictating" lessons to students direct from a text-book.

46. It is recommended that for each school and for each shop, a continuous and systematic programme of maintenance of equipment be developed. In general, there should be planned replacement, and repairs should be made to all equipment that is not up to minimum industrial production standards.

47. It is recommended that a thorough study be made of the particular job skills needed in industry throughout the country in order to revise the curricula and courses of study accordingly where this is necessary. The newer techniques and trades such as air-conditioning and refrigeration, construction-drafting, diesel maintenance, etc. would have to be examined. The Ministry of Education, aware of this situation, has already initiated studies along these lines.

48. It is recommended that in the last year of training a specific period be allotted to practical training in appropriate industrial workshops so that when students graduate they will already have obtained some real work experience in an industrial atmosphere.[1]

49. It is recommended that the Ministry of Education engage in a building-renovation and re-equipment programme to bring up to date the Benghazi technical and clerical training centre (vocational trade school). This would help in meeting the requirements of industry and of new vocational training trends.

50. The great majority of students leave the vocational trade schools without completing their courses. Inadequate advice on selection of a career is considered to be one of the reasons for this. It is therefore recommended that a broad and comprehensive vocational guidance programme be established in the pre-vocational and vocational trade schools to provide an adequate orientation not only to students already enrolled but also to prospective students and to graduates.

---

[1] The Vocational Training Recommendation, 1962, states that: "Practical training in training institutions should: .....

(b) if possible and necessary, include or be completed by periods of practical experience in an undertaking so that trainees may not only become familiar with a working atmosphere but are also enabled to acquire normal work speed and skill on the job." (Paragraph 27(2)(b)).

51. To a large extent the success of vocational education and its direct contribution to the economy of the country hinge on the qualities and fitness of the vocational staff. To qualify as a vocational instructor the candidate must be a master of the trade he will teach. He must then learn the principles of teaching so that he can be a successful teacher. Most of the teaching staff of the vocational trade schools lack qualification in these respects. It is recommended that every effort be made to implement as soon as possible the vocational school teacher-training programme which the expert submitted to the Under-Secretary of Education.

52. It is recommended that a certification system be established so as to set standards for the certification of teachers, instructors and supervisors of vocational education. A certification plan was included in the vocational school teacher-training programme mentioned above.

53. Incentives are needed to attract better prepared personnel into vocational teaching. It is therefore recommended that an adequate salary scale be established in order to attract well-qualified, fully experienced and trained personnel. The salaries payable should be commensurate with those which the same people would be able to earn in industry.

54. One of the most serious handicaps to economic and social development in Libya is the difficulty of finding people for jobs which in most other countries are filled mainly or in part by women. The expert observed that there were many responsible citizens who were anxious to see that women play a more prominent role in the life and economic development of the country. It is recommended that a study be made of the vacancies in industrial occupations which could be filled by women, and that appropriate training programmes for girls be established. A good start might be the organisation of vocational diversified occupations programmes for girls in the secondary schools of the country.

H. Industrial Training Centres

55. The Ministry of Industry has designed vocational training centres which will serve as nuclei of proposed industrial estates for the towns of Derna and Misurata and help to meet the need for skilled craftsmen which is foreseen in those plans.

56. The programme of training at these centres resembles the preparatory stage of instruction at the technical and clerical training centres (vocational trade schools) of the Ministry of Education at Sabratha and Benghazi. Although the Ministry of Education does not have any such centres in Derna

and Misurata, the Higher Committee on Vocational Industrial Education of the Ministry decided that the preparatory stage of instruction at their centres should "be frozen until the Vocational Training Co-ordination Executive Committee be formed and decide what Ministry should undertake its running". This was the first step taken towards the co-ordination of vocational training schemes in the country.

Industrial Training Centre at Derna

57. The vocational training centre in Derna was to start classes in October 1965, with the assistance of the Government of the Federal Republic of Germany. Training will be of three years' duration with basic training to be offered in the first year to 90 trainees from Derna and neighbouring towns. Courses will be offered in machine-shop, electricity, and auto-mechanics. A good feature of the centre is that trainees will be boarded with community families. This centre will also provide facilities for supplementary instruction to the trainees of the on-the-job training programme conducted in this community, and technical related classes for adult workers.

Industrial Training Centre at Misurata

58. A training centre similar to the one at Derna is being established in Misurata. The trainees at this centre will board in a hostel constructed in the school grounds. Training is expected to start in October 1966 and two-year courses of instruction will be offered in the automotive, machine-shop, electrical and welding/metal working trades; the planned capacity is 120, based on an enrolment of 60 trainees per year. On satisfactorily completing the course, the trainees will be placed with local private or Government enterprises for one year's practical experience, during which time they will continue to attend the centre weekly, on day-release, for related theoretical studies. This centre has at present no foreign or international agency support. The Government has made a request to I.L.O. for assistance only in selecting senior technical personnel to operate the centre. It is recommended that the selection of equipment and the preparation of instructional materials be started soon so that the centre may commence operations and produce skilled workers with a view to helping to match the expansion of industry in the area.

Carpet-Weaving Training Centre

59. A carpet-weaving training centre is in operation in Benghazi. Another was shortly to be opened in Derna. Six months' training courses are offered to girls over 12 years of age; no minimum requirements are laid down in respect of prior academic preparation. At the time of the expert's mission, 50 girls were

enrolled at the centre, which is equipped with wool-carding, spinning and washing facilities. The wool-carding and spinning section supplies the needs of the local market as well as those of the small-scale industries centre in Sebha.

60. Besides the carpet-weaving centre in Benghazi, two additional centres are in operation in the Fezzan Province. The main purpose of these centres is the manufacture of carpets and training activities are limited to the manufacturing needs and strictly geared to them.

61. No specific evaluation of these centres is made in this report inasmuch as an I.L.O. expert in small industries is assisting the competent authorities in the Ministry of Industry in improving the working and training conditions of such centres. He is at present working on their reorganisation.

I. Summary of Principal Recommendations

62. The principal recommendations in the light of the vocational training expert's mission are as follows:

(a) that existing and future vocational training programmes be co-ordinated through the Vocational Training Co-ordination Executive Committee Secretariat to be established within the Ministry of Planning and Development for that purpose;

(b) that the pilot vocational training centres envisaged under the Special Fund project form the basis of a comprehensive vocational training scheme for the country;

(c) that greater advantage be taken of the possibilities afforded by in-plant training programmes in accordance with the proposals made for improving these programmes;

(d) that a basic education programme be established for adults, as well as evening classes to enable adult workers to train for more responsible jobs;

(e) that action be taken to improve and reorganise the vocational education programme in accordance with the suggestions made by the expert or put forward in this report;

(f) that a training programme for vocational teachers and instructors be implemented at an early date and that an adequate salary scale for such personnel be established in conjunction with this programme.

APPENDIX I

Copy of Document used by the Expert during his Research

QUESTIONNAIRE ON INFORMATION ON THE VOCATIONAL TRAINING PROGRAMME CONDUCTED BY YOUR MINISTRY

1. What type of training programme do you operate?
2. What are the general and specific objectives of the programme?
3. What is the duration of training of each programme?
4. Give the location of training centres (place of meeting).
5. What are the occupational objectives for each training centre?
6. Describe the curriculum - subjects offered and number of hours per week, etc.
7. What are the entrance requirements - age, academic preparation, etc.?
8. Give the enrolment per group - teacher/student load.
9. Furnish copies of outlines of courses for each subject or occupational objective.
10. Furnish copies of student records.
11. (1) Class progress chart
    (2) Individual student progress record
    (3) Grade or report cards.
12. Furnish copy of teacher or instructor student attendance record book.
13. Furnish the titles of textbooks and manuals used in each occupational objective.
14. Furnish the titles of textbooks and manuals used in each general education and related information course.
15. What types of audio-visual or other teaching aids are being used in the training programme?

16. Furnish samples of certificates or diplomas issued.

17. Furnish samples of instruction sheets such as job sheets, operation sheets, information sheets and others.

18. Furnish samples of other forms used in the programme.

19. What student selection schemes do you use?

20. What is the academic and professional preparation of teachers and instructors?

21. Give salaries of teachers, instructors and administrative staff.

22. What teacher-training is being offered to teachers and instructors?

23. Give number of academic teachers, related subject teachers and shop instructors in each training centre.

24. Furnish the following student statistics:

    (1) Number of students enrolled in each centre during training period.

    (2) Number of graduates.

    (3) Number of drop-outs and reasons for dropping courses.

    (4) Follow-up of graduates.

    (5) Number of employed graduates in occupation for which they received training.

25. What student services are being offered?

    (1) Library service

    (2) School cafeteria

    (3) Transport service

    (4) Work clothing

    (5) Recreational activities

    (6) Student clubs

    (7) Others.

26. How many fellowships to study abroad have you offered?

27. Give pay schedules or stipends paid to students and other benefits.

28. Give size of shops and classrooms used in the training programme.

29. Give composition of advisory and craft committee.

    - How often do they meet?

APPENDIX II

(Document compiled during the mission from the replies to the questionnaire sent to Ministries with vocational training programmes).

REPORT ON VOCATIONAL TRAINING PROGRAMMES IN OPERATION

Vocational Training Projects under the Ministry of Industry (as of 13 March 1965)

On-the-job Training Programmes

1. This is an in-plant training programme of a short-term duration of 12 months.

2. The objective is to train semi-skilled workers.

3. Training is being offered in private workshops and industries and in the Government Training Centre for Carpentry in Tripoli.

4. The first training session was offered from November 1963 to November 1964 in Tripoli, Benghazi and Derna.

5. Training was offered in the following fields:

   Auto-mechanics, electricity, welding shoemaking, machine-shop, tyre-repairing, carpentry, plastic works, typewriter-repairing and tailoring.

6. Training is offered during 38 hours a week in on-the-job (in-plant training) with four hours in related theoretical courses (mechanical drawing, arithmetic and technology) offered in separate classrooms.

7. Training is offered to Libyans, 16 to 24 years of age, with a Primary Certificate.

8. The number of trainees who completed training in the 1964-65 session is 241 in the following occupations and communities:

Trade or occupation	Tripoli	Benghazi	Derna	Sebha	Total
Auto-mechanics	61	6	-	1	68
Electricity	19	4	-	-	23
Machine Shop	17	-	-	-	17
Carpentry	36	19	32	-	87
Welding	32	1	-	-	33
Shoe-making	-	4	-	-	4
Plastic works	1	-	-	-	1
Tyre-repairing	-	2	-	-	2
Miscellaneous trades	6	-	-	-	6
Total	172	36	32	1	241

Vocational Industrial Education Projects under the Ministry of Education (as of 13 March 1965)

1. Technical Industrial Education Schools:

(a) These schools have the general objective of "training Libyan youth to acquire technical skills in the various fields of technical education with a view to increasing productive capacity in industry, trade and engineering installations."[1]

(b) The specific objective of the technical industrial schools is "to supply the industrial public and private sectors with technically trained manpower at the various levels in order to realise the industrial development projects in the Libyan Development Plan."[1]

---

[1] Information on the Vocational Training Programme - Ministry of Education, Kingdom of Libya.

(c) The Ministry provides two distinct stages at the Technical Industrial Schools: (1) The Preparatory Stage and (2) The Secondary Stage.

(d) The duration of vocational studies at the preparatory stage is four years. At the secondary stage the vocational studies take three years.

(e) Technical studies at the Applied Engineering School (for technicians) take four years.

(f) The vocational trade schools are located in Sabratha and Benghazi. The School of Applied Engineering is at Al-Ghiran (10 km. to the west of Tripoli).

(g) The entrance requirements are the following: "In addition to the general requirements which must be fulfilled by every Libyan student, i.e. to be physically fit and free from infectious diseases, the nominees must fulfil the following conditions:

(1) Nominees for the preparatory stage should be preferably over 13 years of age and hold a primary education certificate.

(2) Nominees for the secondary stage should hold a preparatory education certificate."[1]

(h) Vocational industrial students receive the following stipends:

(1) <u>Boarding students</u>

Secondary stage	£L. 8.0 per month
Primary stage	£L. 5.0 per month

(2) <u>Day students</u>

Secondary stage	£L. 5.0 per month
Primary stage	£L. 3.0 per month.

(i) Other benefits received by students:

(1) Boarding students receive free board and living accommodation, free clothing, including workshop overalls.

(2) Day students get one free meal at 10.30 a.m. and free workshop overalls.

---

[1] Information on the Vocational Training Programme - Ministry of Education, Kingdom of Libya.

(3) Students receive "part of the yield of productive projects carried out by them during the scholastic year under the supervision of the instructors."[1]

(k) Classrooms and Shops. "There are no statistics regarding the area of classrooms in the vocational trade schools, but in general, they may be from 30 to 60 square metres. Workshops of vocational trade schools are for the most part sheds which previously belonged to the Italian or British Army and which were not originally designed as vocational workshops."[1]

2. The Programme of Studies for the Preparatory Stage is as follows[2]:

Subject	Period per week				Total
	1st Year	2nd Year	3rd Year	4th Year	
1. Religion	1	1	1	1	4
2. Arabic Language	6	6	4	4	20
3. English Language	5	5	4	4	18
4. Social Studies	3	2	-	-	5
5. Mathematics	3	-	-	-	3
6. Science and Health	2	2	-	-	4
7. Chemistry and Physics	-	-	2	2	4
8. Physical Training	1	1	1	1	4
9. Shop organisation and Management	-	-	-	1	1
Geometrical Drawing	2	-	-	-	2
11. Trade Drawing	-	2	4	4	10
12. Trade Accounting and Measurements	-	3	4	3	10
13. Trade Techniques	2	2	2	2	8
Total	25	24	22	22	93
14. Workshop	19	20	22	22	83
Grand Total	44	44	44	44	176

[1] Information on the Vocational Training Programme - Ministry of Education, Kingdom of Libya.

APPENDIX III

(Document compiled during the mission from the replies to the questionnaire sent to Ministries with vocational programmes).

ON-THE-JOB TRAINING PROGRAMME OF THE MINISTRY OF INDUSTRY FOR 1965-1966

1. The number of trainees enrolled in the 1965-66 session is 919.

2. They will receive training in the following occupations:

   auto-repairing, general mechanics, electricity, welding and plumbing, carpentry, painting and aluminium work, tailoring, typing, typewriter-repairing, storekeeping, shoe-making, tyre-repairing, air-condition repairing and maintenance, and electric station repairing and maintenance in the following Muhafadas: Tripoli, Misurata, El Homs, Zawya, Gharian, Benghazi, Derna, El Beida, Tobruk and Sebha.

3. The total stipends paid to the trainees who received training in the 1963-64 session was £L.85,000.

4. The total stipend to be paid to the trainees receiving training in the 1965-66 session is about £L.216,000.

5. Fifteen supervisors were used in giving training to the 333 trainees initially enrolled in the 1963-64 session.

6. Thirty supervisors are being used in giving training to the 919 trainees enrolled in the 1965-66 session.

7. The selection of trainees is based on the level of general education giving priority to the oldest candidates. No psycho-technical tests were or are being used in the selection of candidates for training.

8. The trainees (supervisors) used in the training programme were recruited from the graduates of the vocational preparatory and secondary schools of Sabratha and Benghazi.

9. Upon completion of training the trainees receive a certificate indicating the specific phases of the trade or occupation in which they received training.

10. A short teacher-training course of two hours per week, during three months, was offered to the trainers (supervisors).

11. Twenty-five supervisors and related theoretical teachers were employed in the 1963-64 session.

12. Thirty supervisors and related theoretical teachers are to be employed in the 1965-66 session.

13. Work clothing was and is to be provided to the trainees.

14. Forty-two piastres per day and participation in the National Insurance Organisation were the stipends and fringe benefits received by trainees in the 1963-64 session. For the 1965-66 session the stipends are to be raised to 60 piastres.

15. No advisory or craft committees have been organised as yet, but "regular meetings with private workshops managers are organised to discuss training aims and problems".

16. Training is offered to the trainees under a written agreement signed by the Ministry of Industry and private workshops.

17. The number of applications received in the Ministry of Industry for training in the various training centres during the 1965-66 session was 6,575.

18. The number of training stations available is 919.

19. The following is a breakdown of the applications received and the training stations available:

Muhafadas	No. of Applicants	No. of Training Stations Available
Tripoli	2,525	437
Benghazi	1,052	271
Sebha	114	53
Misurata	660	22
El Homs	202	9
Zawya	1,077	10
Gharian	385	5
Derna	392	75
Tobruk	53	16
El Beida	115	21
Total	6,575	919

Training in Leather Tanning

1. This is an in-plant on-the-job training programme of "short-term" duration, i.e. one year.

2. The objective is to train skilled workers in leather tanning to be employed in the new government tannery in Benghazi.

3. Training at the government pilot tannery in Tripoli started in March 1960 in all specialities concerning modern tanning techniques.

4. Training is offered in practical tanning with four hours in related theoretical subjects.

5. Training is offered to Libyans, 16 to 24 years of age, with a Primary Certificate.

6. Trainees annually enrolled are under the supervision of one F.A.O. expert and an expatriate specialist in leather tanning. It is expected that ten trainees will be trained in the one-year period.

7. Local trainees will receive a sixty (60) piastres stipend per day while trainees coming from other towns will receive 100 piastres per day.

Training in Printing

1. This is a project under study with the Ministry of Guidance and Information.

2. It is an on-the-job training programme of short-term duration - one year.

3. The objective is to train skilled workers in printing techniques to be used in the government printing shops in Tripoli, Benghazi and Sebha.

4. Training is scheduled to begin about August 1965.

5. Training is intended to cover modern printing techniques.

6. Entrance requirements: Libyans 16 to 24 years of age, with a Primary Certificate.

Training in Wool Carpet-Making and Dressmaking for Girls

1. This is an institutional long-term programme to train young Libyan girls in carpet-making and dressmaking. Duration of training is 18 months.

2. It was started in Beghazi in 1959. Another centre will be opened in Derna in June 1965.

3. 38 hours a week of practical training are offered. For the time being no theoretical training is available.

4. Training is offered to Libyan girls, above 12 years of age, without any minimum academic preparation.

5. Fifty trainees are enrolled in the Benghazi centre under the supervision of three instructors. The same enrolment is expected for the Derna Centre.

Fishery Training Programme

1. This is an on-the-job training programme under the Department of Fisheries of the Ministry of Industry.

2. It is a short-term programme of 12 months' duration.

3. The objective is to train Libyans in the techniques of the fishing trades such as mounting nets, handling and classifying fish, use of mechanical devices in fishing and (primary) elements of navigation.

4. Training started in the ports of Tripoli and Benghazi in 1962. A new programme will be started soon in Derna.

5. No limitation of working hours has been established for this instruction.

6. Training is offered to Libyans, 17 to 27 years of age, with a Primary Certificate.

7. The number of trainees under training in Benghazi is 12, under one instructor; in Tripoli six, under one instructor.

8. All training given is practical, no related subjects accompany the practical training.

9. A certificate is issued by the skippers to the trainee upon completion of training.

10. Training is offered by two qualified skippers holding Captains' Navigation Certificates, one being paid by the German Government, the other by the Libyan Government.

11. The number of trainees completing training was nine in 1962, 12 in 1963, and 16 in 1964.

12. Upon completion of their courses all trainees started to work in the trade in which they had received instruction.

13. The trainees receive free transportation service to the fishing ports, work clothing, a stipend of 60 piastres per day, and a sea bonus according to catches of fish.

14. This training programme is organised with the collaboration of the Libyan Fishing Co-operative.

Small-scale Industries Programme

1. An on-the-job training programme is actually in operation in the small-scale industries centre in Sebha. It is undergoing a complete reorganisation.

APPENDIX IV

(Document compiled during the mission from the replies to the questionnaire sent to Ministries with vocational training programmes).

CONTEMPLATED VOCATIONAL TRAINING PROGRAMME, UNDER THE MINISTRY OF INDUSTRY

Vocational Training Centres in Derna and Misurata

1. This is an institutional training programme of long-term duration (three years).

2. The objective is to train skilled workers.

3. Training is to be offered in Derna, starting October 1965, in the school buildings being constructed in this city with the assistance of the German Government. Training at the Misurata Centre is planned to start in October 1966. This Centre has no foreign or international agency support for the time being. A request has been sent to I.L.O. asking for the assistance of this agency in providing the technical personnel to operate the school and in training Libyan teachers at the I.L.O. Turin Training Centre.

4. Training will be offered in the following fields:

Derna	Misurata
Auto-mechanics	Auto-mechanics
Machine-shop	Machine-shop
Electricity	Electricity
	Welding.

5. Practical training is to be offered during 28 hours a week and related training (related subjects) during 12 hours a week in the shops and classrooms of the vocational institutions at Derna and Misurata, according to the programme suggested by the Government.

6. Training is to be offered to Libyans, 14 to 16 years of age, with a Primary Certificate.

7. The total enrolment in the three-year programme will be 90 students in the three trades to be offered in Derna and 120 in the four trades to be offered at Misurata.

8. It has not been defined, as yet, the stipends to be received by the students, if any.

9. Nine (9) Libyans and four (4) German instructors will be used in giving training to the 90 students to be enrolled in Derna, fifteen (15) instructors will be recruited to train 120 students in Misurata.

10. The selection of students for training is to be based on the general level of education, giving priority to the oldest candidates.

11. The Libyan teachers and instructors of the Derna Centre (counterparts of the German instructors) will be graduates from the vocational schools of Sabratha and Benghazi and will follow a special training course in Germany for two years. I.L.O. co-operation is being requested for the teachers and instructors of the Misurata Centre.

12. Upon completion of training, graduates will receive a diploma indicating the specific trade or occupation in which they receive training.

13. Work clothing is to be provided to students enrolled.

<u>Accelerated Training Programme with the Assistance of the American Friends of the Middle East (Training in Mobile Centres)</u>

1. This is an institutional, accelerated training programme of a short-term duration: four months per session. Training will continue with different groups for an initial duration of two years.

2. The objective is to provide diesel- and gasoline-engine mechanics; clerks specialised in materials control, inventory procedures and warehousing; shop supervisors. Training will be at the first-class, semi-skilled level.

3. Training is to be offered in specially constructed workshops (dismountable type). Two mechanics training centres will be established, one in Tripoli and the other in Benghazi. The Administrative and Clerical Training Centre will be established in Tripoli.

4. Training is to be started three months after approval of the proposal.

5. The American Friends of the Middle East (A.F.M.E.) has presented an outline course of study for each of the fields of training.

6. The Mechanics Training Centre in Tripoli will train 16 men per group every four months or 96 in the two years' duration of the project; the same number in the centre of Benghazi. The Administrative and Clerical Training Centre in Tripoli will train two 16-men groups every four months and produce 160 to 192 trainees over a two-year period.

7. The minimum educational requirement for enrolment in the Mechanics Centre is preparatory education.

8. Upon completion of training, trainees will be classified as first-class mechanic helpers and can proceed with on-the-job training to qualify as full journeymen mechanics.

9. A.F.M.E. will provide instructional materials such as text books, manuals, etc.

10. Stipends to be received by trainees have not been decided yet; probably they will receive 60 piastres per day.

11. A.F.M.E. will offer short four-month specially tailored training courses for carefully selected men in supervisory or management operations.

12. A.F.M.E. proposes that five carefully selected Libyans be sent afterwards to the United States for short-term intensive training.

APPENDIX V

MEETING OF THE JOINT PLANNING COMMITTEE ON VOCATIONAL TRAINING CO-ORDINATION

A meeting of the Joint Planning Committee was called by the Minister of Planning and Development to be held on 28 August to discuss the co-ordination of vocational training in Libya and the recommendations which the I.L.O. Vocational Training Adviser had presented to the Under-Secretary of State of the Ministry of Planning and Development.

The meeting was postponed until 4 September at which date the Joint Planning Committee decided to call the Expert-Adviser on the following day to present to the Committee the recommendations he had to make as to the co-ordination of vocational training.

The meeting was held in the library of the Ministry of Planning under the able chairmanship of Mr. Hamid Abeidi, the Minister of Planning and Development and with the attendance of the following: Dr. Alo Attiga, Under-Secretary of Planning and Development; Mr. Abdulasis Kamal, Under-Secretary of Industry; Mr. Ramadan Nasri, Under-Secretary of Finance; Mr. Othman Ghirbi, Under-Secretary of Agriculture; Dr. Pitt Hardeker, Economic Adviser to the Prime Minister; Mr. Rami Sarrag, representing the Ministry of National Economy; Mr. Kasim Sherlala, Director of Economic Research Section in the Bank of Libya; Mr. Mohamed Mariamai, Under-Secretary of Labour and Social Affairs; Mr. M. Bourgrara, representing the Ministry of Education; Mr. Mahud Derbi, Assistant Under-Secretary of Labour and Social Affairs; Dr. Kairy Sogier, Director of Planning and Agricultural Economy; Mr. Abu Bakr Sherif, Director of Economic and Social Affairs Division of the Ministry of Planning and Development; Dr. Subhas Dhar, Principal Planning Adviser, Ministry of Planning and Development; Mr. G. Hamaoui, O.P.E.X. Head Training Department, Ministry of Industry, and Mr. A. Figueroa-Colon, I.L.O. Vocational Training Adviser, Ministry of Planning and Development. Messrs. G. Malti and G. Tamemi, both from the Ministry of Planning and Development, acted as secretary and translator respectively.

The secretary read, in Arabic, the memorandum the I.L.O. Vocational Training Adviser had sent to the Director of Economic and Social Affairs on 5 June 1965. Then the document was discussed very thoroughly, especially by the Under-Secretaries of Labour and of Industry, who engaged in a very lengthy discussion on the interpretation of technical terms such as apprenticeship,

technical training, industrial education, accelerated training, and on-the-job training. The Expert-Adviser clarified some of the points under discussion when the Under-Secretary of Planning and Development called upon him to do so.

Upon the decision of the chairman, a subcommittee was set up composed of one representative each of the Ministries of Labour, of Industry and of Agriculture and the I.L.O. Vocational Training Adviser. This subcommittee was to meet in the same place at 6 p.m. of the same day.

This subcommittee drafted some conciliatory approaches to the determination of fields of competence of each Ministry in vocational training and on the following day, submitted its draft to the Joint Planning Committee. The discussion was continued by the Under-Secretary of Industry who wished certain programmes which had been left out from the revised fields of competence to continue to operate in his Ministry. The Under-Secretary of Planning and Development accepted this request and the draft was amended accordingly.

At this time, much of the discussion developed around the Arabic translation made of the English original submitted by the I.L.O. Vocational Training Adviser. Some Arabic terms did not express the concept as conceived by the Adviser and this gave ground for some debate by the Under-Secretaries with a command of the English language.

Finally the Under-Secretaries approved the fields of competence of each Ministry and the vocational training co-ordination plan as presented, with some amendments, by the I.L.O. Vocational Training Adviser.

Inasmuch as there exists in the Government a Joint Planning Committee with functions different from those of the Committee suggested, the latter will from now on be called the Vocational Training Committee. This Committee will meet every three months.

The establishment and functions of the Vocational Training Co-ordination Executive Committee (V.T.C.E.C.) and the Vocational Training Co-ordination Executive Committee Secretariat (V.T.C.E.C.S.) were also approved. The V.T.C.E.C. will consist of the Directors of Training of the Ministries with vocational training programmes. It will meet every month and will render annual reports and any other reports when called for by the Vocational Training Committee. The Vocational Training Co-ordination Executive Secretariat will be attached to the Ministry of Planning and Development and will form part of the Economic and Social Affairs Division of that Ministry (see annexures).

The Expert-Adviser deeply appreciates the interest shown by Dr. A. Attiga, the Under-Secretary of Planning and Development and the present Director-General of the Economic and Social Affairs Division, Mr. Abu Bakr Sherif, in making it possible that this meeting be held before the departure of the I.L.O. Vocational Training Adviser. The established delineation of the fields of competence will open the way for the approval of the Special Fund project as submitted by the Government of Libya. So as to facilitate the efficient operation of existing and future vocational training programmes to be organised in the country, the Ministries will co-ordinate their efforts in the development of the required training schemes to meet the acute shortage of skilled workers in Libya by observing standard governing principles which may avoid any duplication of effort in the establishment of such vocational training schemes.

Annexure A

FIELDS OF COMPETENCE OF THE MINISTRIES WITH VOCATIONAL TRAINING PROGRAMMES

(As approved by the Joint Planning Committee on 6 September 1965).

MINISTRY OF EDUCATION

1. Pre-vocational Information and Training Programmes, such as: industrial arts courses, and vocational information and guidance programmes.

2. Long-termed Trade Training Programmes designed for the preparation of youth for employment and to be offered in educational institutions at a Secondary Education Level, including Diversified Occupations Programmes.

3. Educational Training of Technicians, Degree Engineers, Managerial Personnel, Teachers, Instructors and Lecturers, that is, all training requiring post-high school or university education.

4. Educational Up-grading of Workers, that is, courses needed by workers to improve their general education, such as literacy and fundamental education programmes to be offered during the workers' non-working time.

MINISTRY OF INDUSTRY

1. Industrial Accelerated Training Programmes designed to offer in-plant or factory training to adult workers to meet the immediate needs of industry.

2. Industrial training programmes for the youths including apprenticeship schemes basic to those trades presently undertaken by the Ministry.

3. Specialised Training Centres to be established for the training of semi-skilled workers or single-machine operators for immediate employment in industry.

4. Training for small industries as handicrafts and cottage industries to be established to produce articles utilising elementary natural resources like leather, woollen yarns, metals, etc., which may facilitate the establishment of small industries.

5. Mobile Units (mobile shops on wheels) to facilitate training in remote areas where it is not possible to offer institutional training or the setting-up of temporary shops in remote areas and which can be dismantled and transferred to other areas where the training is needed.

MINISTRY OF LABOUR

1. Apprenticeship Training Programmes designed to provide vocational training to youths entering various industries.

2. Institutional Accelerated Training Programmes to provide skilled and/or semi-skilled labour, provided that any such programmes must not overlap or duplicate any projects undertaken by other Ministries.

3. Vocational and social rehabilitation programmes designed to offer vocational training for mentally, socially, or physically handicapped persons in institutions specially designed for such purposes or in industrial plants where special programmes can be organised for the training of blind or handicapped persons.

4. Evening Extension Courses designed for the upgrading or retraining of workers in new skills and technology.

5. Supervisory Training Programmes designed to offer training which may upgrade the skill of workers to assume positions of greater responsibilities such as foremen and shop supervisors.

Annexure B

VOCATIONAL TRAINING CO-ORDINATION SET-UP

(As approved by the Joint Planning Committee on 6 September 1965).

1. Vocational Training Committee

   a. To be organised at the Under-Secretaries level.

   b. Will be composed of the Under-Secretaries of Planning and Development, as chairman, and of the Education, Industry, Labour and Social Affairs, as members.

   c. Will act as a national advisory board for manpower and training.

   d. Will deal with matters of manpower and vocational and training policy.

   e. Will meet every three months.

   (As was approved in the 11th November 1963 meeting, "the Under-Secretaries of State of the Ministries concerned would enter the scene only initially and, later on, on such occasions where no agreement could be reached at the level of Director (of Technical Departments)".)

   This body which will concern itself with the over-all inter-relationships of economics, manpower planning, education and training and similar aspects that must be considered at Government level, could provide the necessary weight to develop the proper leadership and organisational machinery to bring the respective Ministries together in meeting a common goal.

2. Vocational Training Co-ordination Executive Committee

   a. To be organised at the Directors of Technical Departments level.

   b. Will be composed of the Directors of Technical Departments and Officials responsible for manpower planning, vocational education, and vocational training. The chairman will be the delegate from the Ministry with no executive functions, that is, the Ministry of Planning and Development.

c. Will act as the co-ordinating body of all manpower planning, vocational education and vocational training activities in the Ministries with these fields of activities.

d. Will meet every month.

Will deal with setting recommendations to the Vocational Training Co-ordination Executive Committee Secretariat for the implementation, with the Ministries concerned, of vocational education and vocational training programmes. As was approved in the 11th November 1963 meeting, this committee will deal also specifically with:

(a) Evaluation of the manpower situation by utilising all available information; with submission of annual reports and any other reports requested to the Vocational Training Committee.

(b) Assessment of the training requirements resulting from the manpower situation and its anticipated development.

(c) Planning of vocational education and vocational training facilities and schemes including, where appropriate, planning requirements as regards space, equipment and instructors.

(d) Consideration of ways and means to assess and, where appropriate, to supervise the implementation of vocational training schemes.

(e) Suggestions of rules according to which stipends, grants, and awards may be granted to trainees and/or students in the respective fields.

(f) Suggestions of rules according to which employers who take part in training schemes may be reimbursed for their training expenses.

(g) Suggestions of rules according to which employers benefiting from vocational training activities may be called upon to contribute to the training expenditures.

(h) Recommendations concerning the introduction of a vocational guidance system prior to, during, and subsequent to vocational training.

(i) Recommendations concerning the introduction of a placement service for graduates from vocational training schemes, or concerning other appropriate means to channel such graduates into jobs for which they are suitable.

(j) Promotion of the utilisation of modern teaching and instruction methods, including the use of audio-visual aids, and suggestions of other appropriate means to improve the standards of vocational training.

(k) Recommendations concerning the desirability of prevailing training for specific trades or occupations.

(l) Recommendations concerning the allocation of funds to vocational training programmes.

(m) Recommendations concerning the propagation of a public appreciation of vocational training and suggestions concerning the organisation of vocational training weeks or other appropriate means to this end.

(n) Setting governing principles to be applied in the establishment and operation of all vocational education and vocational training schemes with a view to standardise procedures and thus eliminate overlapping and duplication of efforts.

3. <u>Vocational Training Co-ordination Executive Committee Secretariat</u>

a. To be attached to the Ministry of Planning and Development and form part of the Economic and Social Affairs Division.

b. Will be composed of one Vocational Training Expert and two counterparts, one of whom will concentrate on manpower aspects of vocational training, whereas the other will, primarily, be concerned with other relevant technical aspects. However, it should be ensured that none of them loses out of sight the co-ordination of vocational training as a whole.

c. The Ministry of Planning and Development will facilitate office space, clerical staff and supplies and materials as needed.

d. It will have as a principal function the co-ordination of the various vocational training schemes in the Ministries and will receive and implement, with the Ministries concerned, the recommendations which the Vocational Training Co-ordination Executive Committee may approve for implementation.

The following functions will be performed by this Secretariat so as to carry out its primary objective of co-ordination of the vocational training programmes:

a. organisation of co-ordination committee's meetings and execution of the necessary preparatory and follow-up work resulting thereof;

b. carrying out such administrative work as not being the responsibility of another department or division in the Ministry of Planning and Development;

c. collection of information concerning the manpower situation and keeping it up to date;

d. evaluation of such information to the end that an assessment of training requirements can be based on them;

e. collection of information concerning existing and planned vocational training schemes and facilities;

f. evaluation of such information to the end that decisions concerning the future operation of existing, and the implementation of new vocational training schemes can be based on them;

g. facilitation of co-operation with other public or private bodies concerned with vocational training by making the necessary contacts, inviting guest members to committee meetings, and by such other means as may be appropriate;

h. such other functions as may be assigned to the Secretariat by the Committee.

*HEALTH OCCUPATIONS EDUCATION; *TECHNICAL NURSES; *ASSOCIATE DEGREES; EDUCATIONAL PROGRAMS; *JUNIOR COLLEGES; GENERAL EDUCATION; REGISTERED NURSES; CERTIFICATION; ACCREDITATION (INSTITUTIONS); ADMISSION CRITERIA; HOSPITALS

Associate degree programs in nursing differ in many ways but are characterized by the following unique features: (1) The majority are conducted by public junior colleges, (2) The program length is two years, (3) Nursing theory and practice are combined with general education courses, (4) Students must meet college and nursing program requirements for admission, including high school graduation, (5) Costs, which are usually minimal, are comparable to those of other students in the college, (6) The purpose is to educate students to be eligible for licensure as registered nurses and to be prepared to give patient-centered nursing care in beginning general duty nurse positions, usually in hospitals. More than 200 state approved programs are listed and National League for Nursing accreditation is indicated for those so approved. (JK)

ASSOCIATE DEGREE EDUCATION FOR NURSING

The Need for Registered Nurses

If you have read much about nursing or have had many contacts with nurses recently, you will know that more registered nurses are urgently needed to care for patients in our nation's hospitals, nursing homes, and other health agencies. Factors that have helped to bring about this need are well known: increased population, scientific and technological advances, more health insurance programs, and growth and expansion of hospitals and other health facilities. The startling fact is that while you are reading this paragraph, new job opportunities are being created and the need for more registered nurses is increasing.

As new job opportunities in nursing have been created, new educational opportunities have become available. A comparatively new and different type of education to prepare more registered nurses is the associate degree program in nursing.

This publication provides general information about associate degree education for nursing, lists state-approved associate degree programs, and indicates those that have been accredited by the National League for Nursing (NLN), which is the national accrediting agency for nursing education. The material was prepared by NLN's Department of Associate Degree Programs to assist prospective applicants and others who may be interested. For more information of a general nature, write to the department. For specific information, write to the individual programs for their nursing catalogues or bulletins.

Associate Degree Programs in Nursing

Associate degree programs in nursing became a part of the American system of nursing education in 1952. Their growth has been remarkable. In 1956, there were fewer than 25 state-approved programs. By the end of 1966, there were almost 220 state-approved programs in 40 of the 50 states and in Puerto Rico, Guam, and the American Virgin Islands.

Although there are variations, a number of features are unique to associate degree programs:

The majority are conducted and controlled by public junior or community colleges (some are in senior colleges or universities, and a few are in private institutions).

Associate degree programs require two years to complete, which may be two academic years or two calendar years.

The course of study combines nursing theory and practice with college-level general education courses in the liberal arts and the sciences.

Students must meet requirements of the college and the nursing program for admission and for graduation.

Costs and living arrangements for nursing students are comparable to those for students in other curriculums in the college. These are usually minimal in community colleges.

The sole purpose of AD programs is to educate students who will be eligible for licensure as registered nurses and who will be prepared to give patient-centered nursing care in beginning general duty nurse positions, usually in hospitals.

This last feature is especially important to note if you are considering a nursing career, for within the occupation of nursing today there are many kinds of nurses with different types of education and equally different job responsibilities. Despite this variety, the majority of registered nurses work in hospitals or other institutions and are engaged in giving direct nursing care to the sick. These nurses usually are called general duty or staff nurses and sometimes "bedside" nurses. Since staff nurses are responsible for direct care to patients, they must possess a high degree of technical nursing knowledge and skill and have an understanding of the scientific principles of the nursing care they give. Theirs is a demanding responsibility.

Because of its unique features, an AD program will meet your needs if:

You would like to become a registered nurse.

Your goal is to give nursing care to the sick as a staff nurse.

You want both a nursing education and some college-level general education.

You want to complete your education in a relatively short period of time.

You would like to obtain your nursing education in a college setting in your own community.

These unique features of associate degree education for nursing also mean that the programs are attractive to married women and others whose family responsibilities require them to live at home, to men who wish to pursue nursing careers, and to older students.

Although the associate degree program in nursing is complete for the purpose described, some of the college credits earned in the program can be applied toward a baccalaureate degree in nursing should a graduate decide later to pursue education for professional nursing. The amount of credit granted depends on the policies of the senior college or university that conducts the baccalaureate degree program (that accepts the students).

Admission Requirements

High school graduation is the minimum requirement for admission to any school or program that prepares its graduates to become licensed as registered nurses. This includes associate degree, baccalaureate degree, and diploma programs in nursing. A school may establish any requirements it wishes above the minimum. The college preparatory, or academic, course in high school is preferred by all schools and required by some. A good academic average is essential. Since admission requirements vary, you should obtain specific information by writing to schools for their nursing catalogues or bulletins.

Licensure

All states regulate by law the practice of nursing and other health occupations. This applies equally to medicine, dentistry, pharmacy, and other fields, and to nursing. Licensure, therefore, has a legal meaning. A license is not a degree.

A graduate of a state-approved associate degree, baccalaureate degree, or diploma program in nursing is eligible to take a state licensure examination to become a registered nurse. Licensure as a registered nurse (R.N.) means that the nurse has met legal requirements to practice in the state in which the license is issued.

The protection of the public is the basic reason for licensing laws, since the public cannot be expected to know the difference between a competent or an incompetent practitioner. In terms of public safety, a licensed practitioner of nursing, a registered nurse, is assumed to be competent. Note especially that a registered nurse's license does not indicate the type of education the nurse has had, since the R.N. may be a graduate of an associate degree, baccalaureate degree, or a diploma program in nursing.

Availability of Funds

A listing of scholarship funds is available on request from the college.

Nationally Accredited Schools

To become a licensed nursing practitioner--an R.N.--you must be a graduate of a state-approved school or program in nursing. State-approved schools have met legal standards set by a state board of nursing. This applies in each of the 50 states.

The American system of education includes another type of educational approval that is important for you to know about. It is called national accreditation.

National accreditation differs from state approval in that it is national (rather than statewide) in scope and is voluntary instead of being required by law. The National League for Nursing is the national accrediting agency for nursing education. Schools that apply for and receive national accreditation must meet national standards of excellence. These standards exceed the legal standards set by state boards of nursing. Enrolling in an NLN-accredited program is your guarantee of getting the best available nursing education of its type.

Following is a list of state-approved programs in nursing education leading to the associate degree. Programs accredited by the National League for Nursing are indicated by an asterisk (*). For specific information about any nursing program, write to the director of the program, c/o the junior or community college, and request a nursing catalogue or bulletin.

Engineering and Technician Enrollments -- Fall 1967

SUMMARY REPORT

by the
ENGINEERING MANPOWER COMMISSION
of Engineers Joint Council

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

January 1968

$1.00

The Engineering Manpower Commission of Engineers Joint Council is charged with the following responsibility:

> "To engage in studies and analyses of the supply, demand, and utilization of engineering and technical manpower; to make recommendations, conduct programs, and develop reports concerning these aspects of engineering and technical manpower; and to carry on such other programs in the field of manpower as may be authorized by the Board of Directors of EJC."

The Commission is made up of men and women from industry, education, government, and the professional societies whose work involves a close association with technical manpower problems. Members of the following engineering societies are currently serving as Commissioners:

--American Society of Civil Engineers
--American Institute of Mining, Metallurgical, and Petroleum Engineers
--The American Society of Mechanical Engineers
--American Water Works Association
--Institute of Electrical and Electronics Engineers
--The American Society for Engineering Education
--American Society of Heating, Refrigerating, and Air-Conditioning Engineers
--American Society of Agricultural Engineers
--American Institute of Chemical Engineers
--Society of Fire Protection Engineers
--Society for Nondestructive Testing
--The Society of American Military Engineers
--The American Institute of Industrial Engineers
--American Institute of Consulting Engineers
--American Institute of Plant Engineers
--American Association of Cost Engineers
--American Society for Metals
--Instrument Society of America
--American Society for Quality Control
--National Institute of Ceramic Engineers
--Society of Women Engineers

Acknowledgments

The principal contributors to this report were, of course, the deans, registrars, and other officials of approximately 870 schools who provided enrollment data on their engineering and technology students. Thanks are hereby extended to all of them for their cooperation in this survey.

Thanks are also due to the American Society for Engineering Education for encouraging and assisting the Engineering Manpower Commission to undertake this survey. Dr. W. Leighton Collins, Executive Secretary, and Dr. George D. Lobingier, Past President and member of the Board of Directors of ASEE, personally contributed invaluable help and advice in making the survey a success.

Donald E. Irwin and Theodore J. Carron, as 1967 and 1968 Chairmen of the EMC Surveys Committee, had an important part in the planning and policy making that went into this project. Richard C. Fremon contributed technical advice in setting up a computer program for handling the data. Thanks are also due to Dr. Donald C. Metz for his pioneering work and advice in connection with the technician portion of the survey.

The survey was conducted under the general direction of John D. Alden, Executive Secretary of the Engineering Manpower Commission, with the assistance of Miss Carol Iceland of the EMC staff in a multitude of essential functions.

Programming and data processing were done by Computer House, Inc. of New York City.

J.D.A.

Introduction

This report contains the highlights of the enrollment survey conducted by the Engineering Manpower Commission of Engineers Joint Council in the fall of 1967.

Questionnaires were sent to all known engineering schools in the U.S. and replies were received from practically all of them. To make the data comparable with previous years, estimates were made for the few schools that did not respond. These constituted less than 3% of the total enrollments reported. Engineering enrollment data are thus entirely comparable with those reported by the U.S. Office of Education in previous years. In a few cases schools were unable to break down their data exactly as desired for this report such as being unable to separate master's and doctor's enrollments in the first year, etc. In such instances an arbitrary division was made on the basis of overall ratios prevailing in previous years. The numbers involved were too small to be significant in the totals.

For the technician survey, questionnaires were sent to all known technical institutes, junior colleges, and other institutions offering programs in engineering technology or industrial technology. Since there is no comprehensive list of all such schools, and new ones are constantly being established, the enrollment figures reported here are only an approximation of the total technician enrollments for the entire U.S. Our figures represent, however, the largest known group of technician schools ever surveyed. In the case of schools having curricula accredited by Engineers' Council for Professional Development, which constitute the solid core of engineering technology education, 100% returns are reported. No attempt was made to estimate enrollment for non-responding schools not on the ECPD list.

Explanations

Explanations of specific features of each data table will be found on the page facing the table. The following additional explanations are general in nature.

Tables showing data by curriculum follow, in general, the designations and groupings used by Engineers' Council for Professional Development in its 1966 list of Curricula Leading to First Degrees in Engineering, with the following exceptions:

--"Biomedical" is an unofficial category added by EMC. No accredited curricula exist with this title.

--"Marine" as used in this survey includes curricula in ocean engineering, marine engineering, and related titles, in addition to the naval architecture and marine engineering curricula accredited by ECPD.

--"Other" includes the welding engineering curriculum accredited by ECPD, as well as a variety of unaccredited curricula not classifiable under any other group.

--"Undifferentiated" refers to students who have not designated a major engineering field or who are in "common core" courses at the lower undergraduate levels.

For the technology schools, a simplified grouping was used consisting of aerospace, civil, drafting and design, electrical and electronic, mechanical, and all other fields of engineering technology; also physical science and mathematics technology, and industrial technology. There are no exact definitions for any of these fields, and in most cases classification was made by the reporting institution itself.

DATA TABLES

ENGINEERING AND TECHNICIAN ENROLLMENTS
FALL 1967

Table I

See page 5 for general notes on interpretation of the survey data.

The totals for women and foreign students are estimated because many schools reported that they were unable to provide this information. For the schools that did report data, the ratio of women and foreign students to total enrollments was calculated year by year. This ratio was applied to the total enrollment for all schools to arrive at the figures shown.

(1) A few schools included Sanitary Engineering under Civil Engineering.

Table II

See page 5 for general notes on interpretation of the survey data.

This table contains several breakdowns of the "all school" data on the top line.

The second and third lines separate those schools on the 1966 list of Curricula Leading to First Degrees in Engineering Accredited by the Engineers' Council for Professional Development from all other schools. These two lines add up to the totals on the top line.

The next two lines distinguish between enrollments in curricula specifically accredited on the ECPD list, and all other curricula. In a few combined fields (such as metallurgical and materials, for example) where a school may have had both accredited and non-accredited curricula in the field, all enrollments in the entire field were arbitrarily treated as accredited. The resulting overstatement of enrollments in accredited curricula is negligible for all practical purposes.

Lines 6 and 7 separate the publicly and privately controlled schools. In lines 8, 9, and 10 the public group is further broken down into state, municipal, and federal subgroupings, while in the last two lines the private sector is divided into non-sectarian and religious subgroups.

Engineering Enrollment Survey - September 1967

INSTRUCTION SHEET

This survey is being made by the Engineering Manpower Commission of Engineers Joint Council with the support of the American Society for Engineering Education. The objective is to publish timely statistics on engineering enrollments for use in manpower planning by employers, educators, and others. This survey does not replace that conducted by the U. S. Office of Education, but is intended to produce key statistics sooner than available from the more detailed survey. A complimentary copy of the report will be sent to the reporting officer of all participating institutions as soon as published.

PLEASE NOTE THE FOLLOWING BEFORE FILLING OUT THE QUESTIONNAIRE:

Note 1 - Report full time enrollments only, including co-op programs. Include only students enrolled definitely as candidates for an engineering degree.

Note 2 - Curriculum. The groupings are based on the 1966 ECPD listing. Use "Other Specific Engineering" category (line T) only if curriculum cannot be included in any related major group.

Note 3 - Accreditation. For each curriculum field reported, check this column if one or more curriculum in the field is accredited by ECPD at your institution.

Note 4 - Undifferentiated Students. If your institution does not differentiate curricula during the first or second years, report these students only in line U, "Undifferentiated." Do not use this group for students enrolled in "General Engineering" (line J) or "Other Specific Engineering" (line T) curricula.

Note 5 - Fifth Year Students. Report candidates for five year bachelor's degree in column 6, whether regular or co-op program. If the curriculum is an integrated one leading to a five-year master's degree, report fifth year students under first year of master's degree in column 7.

Note 6 - Other Pre-Doctoral Degree. Enrollments for professional degrees beyond the bachelor's but pre-doctoral in level are to be included with master's degree enrollments for this report.

Note 7 - Bachelor's of Engineering Technology. Report only students definitely enrolled in curricula leading to a bachelor's degree or higher. Do not report students in two-year technician curricula.

Note 8 - Women and Foreign Students. Because of the small numbers involved, totals should be reported for all curricula combined. These should also be included in the individual curriculum totals above.

IMPORTANT: See Notes on Reverse Side Before Filling Out This Form

Engineering Technology Enrollment Survey - September 1967

INSTRUCTION SHEET

This survey is being made by the Engineering Manpower Commission of Engineers Joint Council with the support of the American Society for Engineering Education. The objective is to publish timely statistics on engineering technology enrollments for use in manpower planning by employers, educators, and others. This survey does not replace that conducted by the U. S. Office of Education, but is intended to produce key statistics sooner than available from the more detailed survey. A complimentary copy of the report will be sent to the reporting officer of all participating institutions as soon as it is published.

PLEASE NOTE THE FOLLOWING BEFORE FILLING OUT THE QUESTIONNAIRE:

Note 1 - Report students enrolled in technician or technology programs as indicated. Do not report students in curricula leading to an engineering degree at your institution. (A separate questionnaire has been sent to all engineering schools.) See Note 7 for pre-engineering transfer students.

Note 2 - For each field reported, check this column if one or more curriculum in the field is accredited by ECPD at your institution.

Note 3 - Engineering Technicians - students in engineering oriented organized occupational curricula of at least two (2) but less than four (4) year, leading to Associate degree or similar designation.

Note 4 - Physical Science Technicians - students in physical science and mathematics oriented organized occupational curricula of at least two (2) but less than four (4) years, leading to Associate degree or similar designation. (Do not include Medical or Dental Technicians or others not directly related to the physical sciences.)

Note 5 - Industrial Technicians - students in skill oriented organized occupational curricula of at least two (2) years leading to Associate degree or similar designation.

Note 6 - Bachelor of Technology - students in engineering or technically oriented curricula leading to a Bachelor's degree in technology but not to a recognized degree in engineering. Separate categories are provided for engineering technology and industrial technology curricula.

Note 7 - Report only students in non-terminal pre-engineering programs of at least two (2) years duration, leading to transfer to an engineering school for completion of a Bachelor's degree in engineering. To be reported only where the institution itself does not award Bachelor's degree in engineering. Report students in the closest applicable field of engineering technology. If students are not differentiated as to specialized field, report them in line F, "Other."

Note 8 - This column has been provided to report students in master's degree and other post-baccalaureate programs at a few schools.

Note 9 - Civil Engineering Technology - include also architectural, building, construction, highway, structural, surveying, and similar engineering technology programs.

Note 10 - Electrical and Electronics Engineering Technology - include also communications and similar engineering technology programs.

Note 11 - Mechanical Engineering Technology - include also air conditioning, diesel, machinery, and similar engineering technology programs.

Note 12 - Other Engineering Technology - include general, industrial, and other engineering technology programs which cannot be reported elsewhere.

HAWAII

A survey of personnel directors, industrial relations officers, training staff and labor representatives was made to identify the nature and scope of training being conducted within business and industry in Hawaii and to examine the expectations for public education. The survey consisted of two phases: (1) on-site personal interviews with 23 firms considered to be a representative cross section of the larger employers in Hawaii and known to be conducting in-plant training programs, and (2) collection of information from a larger sampling of the business-industry community by mailing questionnaires to 1,684 firms categorized as small employers. Findings which are reported in a narrative discussion included: (1) Business and industry were engaged extensively in training operations in one form or another to increase the productivity of employees and the efficiency of the organizations, (2) The small employer group reported that expansion of vocational education at the high school level as well as expansion at the post-high school level was significantly important as a means of assisting business and industry with training, and (3) The larger employer placed greater emphasis on expansion at the post-high school level and the part-time evening programs. TRAINING ACTIVITIES WITHIN BUSINESS-INDUSTRY:

implications for public education in Hawaii

A Study Conducted by

Hawaii Vocational-Technical Education
Research Coordinating Unit

COMMUNITY COLLEGE SYSTEM, UNIVERSITY OF HAWAII

2327 Dole Street, Honolulu, Hawaii 96822

Project sponsored by State Commission on Manpower and Full Employment

VT005249

The Hawaii Vocational-Technical Education Research Coordinating Unit was established with a direct grant from the U. S. Office of Education, Division of Comprehensive and Vocational Education Research, June 27, 1966, under the research section of 4(c) of the Vocational Education Act of 1963.

Vocational education research coordinating units have been established in 44 states for the express purpose of developing and disseminating information derived through research which can be instrumental in improving existing programs in vocational-technical education; and, developing new programs to meet changing skill requirements.

The Hawaii Vocational-Technical Education Research Coordinating Unit serves all levels of vocational-technical education in the State. Local funding support is being provided by the Community College System, University of Hawaii, which administers and houses the Unit.

The major objectives of the Hawaii RCU are:

1. To stimulate research designed to improve existing programs of vocational-technical education and to develop new programs to meet changing needs.

2. To acquire information derived through vocational-technical education research and disseminate information to those whose interests and needs are related.

3. To guide research efforts into areas of greatest need and coordinate research to contribute to progress of effective vocational-technical education programs.

4. To foster the implementation of research in vocational-technical education in the schools where the impact of vocational-technical education problems are felt.

ACKNOWLEDGMENT

This study was made possible by the interest and willingness of business-industry to become involved in the concerns of the public schools in the development of meaningful occupational educational programs.

Top management officials made themselves available and contributed classified information for the purposes of the survey. The authors were cordially received, and ample time was provided for on-site interviews.

The Department of Labor and Industrial Relations contributed to the personal interview phase of the study by identifying firms conducting in-plant training programs and facilitating interview arrangements.

The Chamber of Commerce of Hawaii facilitated the mail questionnaire phase of the study by providing access to a "master" mailing list.

The Commission on Manpower and Full Employment expedited the study by providing advisory services and supportive funds for the mechanics of the survey.

The authors appreciate the cooperation of all organizations and individuals who assisted in making the survey possible. It is hoped that this cooperative effort to re-identify training, problems and needs will stimulate interest in the coordinated development of manpower programs by both business-industry and public education in Hawaii.

David R. Lynn
John W. Nothom

FOREWORD

Industry-business and public education in Hawaii face dynamic challenges in preparing youth and adults for personal survival and success in our labor force. The many pressures and demands in meeting competition in our changing labor tasks make it increasingly difficult to provide the necessary educational experience and training. To keep pace with our changing economy, existing educational purposes and practice require constant review and revision.

The purpose of this survey was to identify the nature and scope of training being conducted within business-industry and to examine expectations for public education. It is expected that the information gathered will be of assistance in the development of coordinated manpower programs.

IMPLICATIONS

The following implications presented in four separate sections have been drawn from the study by the authors. In order of their appearance the sections report implications regarding (a) necessary research and development activities related to occupational education; (b) changes needed in the occupational curricula and program structure of public education; (c) need for public education to provide business-industry with personnel and facilities to foster, improve and increase the effectiveness of in-plant training programs; (d) new administrative concepts regarding responsibilities of business-industry occupational education.

Implications regarding the need for research and development.

1. That research be initiated and funded in the field of occupational education and manpower development to bridge the gap between the schools and business-industry where the impact of vocational training is felt.

2. That business-industry join public education in initiating research that will provide for the improvement of existing training programs and the development of new programs to meet changing needs.

3. That intensive studies be initiated to determine the most appropriate means of providing youth and adults with the opportunity to develop occupational proficiency.

Implications for changes needed in the occupational curricula and the program structure of public education.

1. That occupational education programs in widely selected occupational areas be developed at the secondary level which will be coordinated and articulated with the post-secondary programs to provide entry into post-secondary programs at several levels. (Not excluding advance placement and early admission.)

2. That secondary occupational programs be coordinated with business-industry and the State Employment Service to provide for "work experience programs" as an integral part of the occupational career oriented student's educational experience.

3. That the exploratory and prevocational function of the secondary industrial arts program be reidentified and broadened to reflect contemporary industry; and, that units of instruction be imaginatively developed and creatively taught.

4. That business-industry personnel and facilities, where feasible, be made available to supplement specialized instruction needed but not always offered by public education.

5. That the existing agreement between the Hawaii State Board of Education and the State Department of Labor and Industrial Relations (State Employment Service) be revised to include both the secondary programs and the post-secondary programs of the community colleges and technical schools. And, that the existing cooperative working agreement be further implemented and expanded to include provisions for the placement of youth in meaningful work experience programs.

Implications regarding the need for public education to provide business-industry with training personnel and facilities.

1. That vocational educators be made available to assist business-industry training personnel in analyzing training needs, developing trainer competencies, and implementing training programs.

2. That the duties of the "vocational teacher educator," College of Education, University of Hawaii, include the responsibility for the development of in-plant teachers and other supervisory personnel in business-industry.

3. That the community colleges and technical schools establish at each campus the position of "coordinator for vocational-technical education" to be responsible for maintaining continuous contact with business-industry and the development of cooperative relationships.

Implications regarding responsibilities of business-industry pertaining to occupational education.

1. That leaders from the total spectrum of business-industry involve themselves with educational administrators in the development and improvement of vocational education in the State.

2. That business-industry and public education cooperatively develop an organizational framework within which the image of the world of work and occupational preparation can be elevated. It is essential that business-industry assist educators in translating known needs into action programs.

3. That business-industry participate directly in manpower training programs by providing assistance in student recruitment, selection, and placement by formulating recommendations and advising on

problems relating to the instructional program; and, providing assistance in keeping instructional staff current with technological change.

4. That the role and function of apprenticeship be examined in view of meeting the training needs of a broader spectrum of occupations. Skill and knowledge requirements for each step of the apprenticeship and labor grade contracts need to be coordinated with the preemployment and part-time course offerings at the community colleges and technical schools.

5. That business-industry make provision within their training structures for occupational instructors in public education to become familiar with new technologies and practices which need to be included in current curricula.

6. That programs not meeting apprenticeship requirements be established by business-industry to provide on-the-job training programs with the schools providing the supplementary related instruction.

SUMMARY

This study was concerned with the nature and scope of educational programs within business-industry based on the opinions of personnel directors, industrial relations officers, training staff and labor representatives regarding school-industry cooperation in meeting manpower needs. Over 50,000 employees, approximately 16 percent of the total labor force in the State were represented in the study.

Areas of study included (a) types and levels of training being conducted by business-industry; (b) extent of business-industry "in-plant" education programs; (c) costs of training programs; (d) opinions as to expectations for public education.

Since the objective of this pilot study was to provide data for further research or action programs, if warranted, rather than an in-depth statistical analysis, findings were reported in narrative form.

The survey consisted of two phases: (a) PHASE I, on-site personal interviews with selected firms known to be conducting in-plant training programs; (b) PHASE II, the obtaining of information from a larger sampling by mail questionnaire.

PHASE I - Personal Interviews.

A total of 23 organizations were contacted and queried in regard to objectives of the study. Interviews were unstructured, but a "guide questionnaire" was used to provide uniformity of on-site assessment. Questions in the "guide" were focused on the objectives of the study.

The sample was determined by the State Department of Labor and Industrial Relations and contacts were established with the authors on

a volunteer basis. This sample was considered to be a representative cross section of the larger employers in Hawaii but not inclusive of all types of business-industry. Smaller employers were represented by only a few organizations. This phase of the study, therefore, does not reflect training practices or needs of this group.

PHASE II - Survey by Mail Questionnaire.

The objective of Phase II was identical of that of Phase I and differed only in methodology and the sample.

Phase II attempted to obtain a broader sampling of the business-industry community by contacting firms categorized as "small employers." The Chamber of Commerce of Hawaii made available to the authors the master mailing list of the organization. This list represented a comprehensive directory of firms and organizations in the community with no indication as to whether or not training was being conducted.

Packets containing an introductory letter, questionnaire and return envelope were mailed to 1,684 individuals and organizations. Firms contacted by Phase I were not included in this sampling.

Conclusions.

The results of the two sample groups (large employer and small employer) were generally consistent with few exceptions. The small employer group reported that expansion of vocational education at the high school level as well as expansion at the post-high school level was significantly important as a means of assisting business-industry with training. The larger employer placed greater emphasis on expansion at the post-high school level and the part-time evening programs.

Based on the data presented in this study, it is apparent that manpower development must be a cooperative undertaking involving business-industry, public education and related government agencies.

Business-industry is engaged extensively in training operations in one form or another to increase the productivity of employees and the efficiency of the organizations.

Public education has a responsibility of preparing local youth for useful, satisfying and gainful employment at the termination of formal schooling. Educators need to appreciate the training problems of industry and assist in the development and implementation of supplemental educational courses to increase occupational efficiency and personal development.

There is an apparent gulf between business-industry and public education which has not been bridged in spite of expressed interest by both parties to develop cooperatively on-going programs. There is evidence that employers are assessing vocational education to determine the amounts and kinds of assistance that are available and that public educators are interested in developing the needed programs. However, it appears that technological developments occur in business-industry more rapidly than cumbersome governmental agencies are able to develop needed programs.

Additional investigation into the needs of business-industry in relation to specific preemployment occupational programs as well as strategies for business-industry people to identify themselves with public education is needed if realistic occupational programs are to be developed.

Only through such partnership will public education be in a position to offer purposeful, meaningful and effective education for the world of work. As the nation's economy adjusts to change, so must its human resources development policies.

SECTION I

THE PROBLEM

President John F. Kennedy in his 1963 Manpower Report stated: Manpower is a basic resource. It is the indispensable means of converting other resources to mankind's aid and benefit. How well we develop human skills is fundamental in deciding how much we accomplish as a nation.

Educators are aware that public vocational-technical schools provide only a fraction of the total occupational education available within any one community. Training is provided by a variety of institutions. It is estimated that the armed services have more persons in training than all colleges and universities in the nation. An extensive amount of education is now occurring within business-industry. Some of these programs are excellent examples of educational planning, and much of the best instructional equipment is to be found there. In a period of accelerating technological change, continuous employment in some occupational classifications demands continuing education. (11:6)

Statement of the problem.

The need for accurate detailed information regarding the education being provided by business-industry has become crucial to the development of state educational plans. The purpose of this study was to identify occupational education programs currently being conducted by business-industry within the State of Hawaii in order that those concerned with the improvement of vocational-technical education would have data to support planning and recommendations. It is not entirely clear why

business-industry provides educational programs. Is business-industry duplicating the efforts of public education? In what areas can public education best provide supportive functions?

A further purpose of this study was to seek specific reasons for business-industry educational activity to determine if there were significant implications for public education. Therefore, objectives of this study were: (a) to determine the nature of educational programs related to occupations currently being conducted by business-industry in Hawaii; and, (b) to determine upon what premise such programs are being conducted and the implications for public education.

Importance of the problem.

The role and function of vocational-technical education in the public schools in Hawaii are of considerable concern. The Second Legislature, 1964, State of Hawaii, requested a study entitled, Education in a Changing World of Work in a Democratic Society, which questioned many on-going practices of the public schools. The Third Legislature, 1967, moved a step further by mandating the development of a "new state master plan for vocational education." This is currently being developed by a committee representing the State Board of Education, the University Board of Regents, and the Commission on Manpower and Full Employment. It is evident that public education can no longer provide all the skills for getting a job and meet the manpower needs of business-industry. But what kind of education is most likely to land that first and second vital job? It is necessary to examine the role that business-industry is performing in education if educators are to discharge their responsibility for planning and developing coordinated, meaningful occupational programs.

It is believed that this study will contribute directly to the implementation of program change and innovation in vocational-technical education to extend and enlarge job opportunities.

Questions for which answers were sought.

In conducting the study, answers were sought for the following questions:

1. In what areas was business-industry providing occupational education?

2. Why was this education being provided?

3. How extensive was such education?

4. What were the expectations of business-industry for public education?

Statement of assumptions.

The following assumptions were made in pursuit of this study: (a) that business-industry accepts the concept of vocational-technical education in the public schools and is interested in continuous cooperation; (b) that top management of business-industry would be responsive and cooperative in providing time for personal interviews; (c) that respondents would be knowledgeable of the broad spectrum of occupational education and related manpower needs; (d) that there were common understandings regarding concepts of training, manpower needs, technological development, economic and sociological trends, and cost effectiveness of programs.

Limitations of the study.

The study was conducted in view of the following limitations: (a) the sample studied in Phase I was determined by, with minor exceptions,

the Department of Labor and Industrial Relations; (b) the sample in Phase II was determined from the master mailing list of the Chamber of Commerce of Hawaii; (c) data and information reported were limited to opinions and observations of the respondents without reference to company records.

Delimitations of the study.

The following delimitations were placed on the study: (a) only those organizations maintaining offices on the island of Oahu were included in the study; (b) the study was only concerned with the education programs of business-industry--the military organizations were not included; (c) the research was not intended to be a statistical study and findings were reported by narrative discussion; (d) there was no intention of an in-depth study. The objective here was a sampling or pilot study to provide data for further research or action, if warranted.

Definitions of terms used.

The following terms are defined to clarify their usage in the context of this study:

1. Business-industry. The term business-industry is used to identify organizations engaged in business, sales, agriculture, construction, manufacturing, transportation and service.

2. Vocational-technical education. The term is used to denote any programs or courses, wherever or to whomever offered, which are specifically intended to prepare persons for a particular occupation and/or up-grade the person within the occupation.

3. Occupational education. The term is used synonymously with vocational-technical education.

4. Training. The term training is used interchangeably with the term education. In general, it is used to refer to those aspects of education which lead to occupational employment. In business-industry the term is commonly used in reference to all educational activity; i.e., "supervisory training," "apprentice training," "training facilities," "training officer."

5. Apprenticeship. The term denotes a formalized training program, according to a written agreement, in a recognized skilled trade requiring two or more years of work experience on the job through employment and supplemented by appropriate related training experience. The related training experience is normally provided by personnel of established vocational-technical education programs.

6. Work study program. This term is used to denote an instruction and work program in which students are employed specifically within the occupations for which their courses in school are preparing them. Work study in this study is used synonymously with cooperative education and work experience. The employment serves the function of a practical laboratory for reinforcing the in-school occupational education. Students in these programs receive both pay and school credit for their work.

7. On-the-job training. This term denotes the process of developing skills and knowledge while employed and receiving direction from a supervisor.

SECTION II

REVIEW OF RELATED LITERATURE

Although there are existing studies concerning education being provided by business-industry, apparently there are few studies that have concentrated on a single community.

Clark and Sloan studied vocational-technical education in industry, merchandising and the armed services. These studies indicated that large numbers are being trained by these groups. The studies were reported by Clark and Sloan in Classrooms in Factories. (4) Currently, Swanson and Elberg are attempting to determine the effectiveness of education now occurring within business and industry in the City of Richmond, California. (10) The October, 1967, issue of VEIN, the newsletter of the Oklahoma Vocational Research Coordinating Unit, reports the recently published study, "Expectations of Oklahoma Firms Concerning Occupational Curricula for State Junior Colleges," by Theodore H. Voth. The completed report was not available; but, the abstract reported the following:

> Business sees a two-fold educational need in an age of rapid technological change: (1) the increasing need for persons with highly specialized training, and (2) the need for persons with social responsibility, cultural maturity, and capacity for change. (12)

Samuel M. Burt, Special Assistant to the Director of the United States Employment Service, recently completed an in-depth study of industry participation and involvement in vocational and technical education programs. In regard to industry-education cooperation in occupational training, he cited the following problems of coordination:

> Unfortunately, industry does not always clearly understand the problems of the educational institution, and vice versa. For instance, industry may not develop definitive manpower policies, nor feel any commitment to employ graduates of the school occupational programs, despite the fact that they may have helped establish the programs. Yet industry expects the schools to meet its needs for new employees. At the same time, the schools may be providing youth with skills for occupations rapidly becoming outmoded and disappearing. (2:6-7)

In a conference concerned with apprenticeship training, Don Irwin of the Chrysler Corporation had this to say:

> Preemployment training and vocational education have been of little value. Schools are not expected to train students for jobs, per se. Students need a greater exposure to more crafts; their ignorance is great. Also, training in math and reading needs greater emphasis. (3:178)

Norman Bowman, Staff Business Writer of the San Jose Mercury, (October 20, 1967) reported briefly on results of a recent study by the Manpower Research Council as follows:

> About half of those answering the questions said they think in-plant training is the answer to curing a skill shortage--but, they also noted such training is handicapped by lack of time, competent instructors and money. (1)

At the local level, the "Oahu Manpower Skill Survey" conducted by the Department of Labor in 1965 determined the number of trainees in formal company training programs. The study did not inquire as to reasons for such programs or implications for the public schools; nor, did the report reflect opinions of needs and trends as seen by top management.

This report was edited, summarized and recently released as "Honolulu's Manpower Outlook--Survey of Demand and Supply of 78 Occupations." The summary of the report stated: "In the fairness to the absence of school programs, it should be pointed out that some of the

occupations have traditionally been filled through on-the-job training wholly and reliance on the availability of skilled workers."

The report further stated: "In many occupations, such as those in the service field, the length of training is relatively short and mostly adapted to employer requirements. Thus, there are some occupations which seem more suitable for employer training rather than formalized school situations." (9:7)

The role of industry in training was expressed by Donald Wolfhope, Director of Training and Personnel Research, C. Brewer & Company, Ltd., during the Governor's Conference on Human Resources, February 1, 2, 1966. He said:

> However, in any organization of any size, the management of that organization is constantly faced with the problem of more skilled jobs in the company just as they are faced with the staffing of the lower skilled job. Most organizations prefer to move people up through their ranks . . . we would like to hire from within and develop our own people. (8:134)

Francis M. Hatanaka in a study to clarify some of the basic problems associated with vocational-practical arts in the State of Hawaii reported that occupational training programs of industry and the armed forces had a definite motivating effect on many students. He recommended: "To this end, there may be substantial merit in the cooperative work-study programs." (6:27)

Dorothy Moore in the Legislative Reference Bureau's Report No. 3 (1966) discussed various concepts of occupational training and expressed the following concerns as to:

> . . . what policies can the State adopt to encourage employers to provide on-the-job training; and, should employers be required to release apprentices during the day for related study?
>
> . . . the boundary between public and private responsibility for training. . .
>
> . . . public expenditure for training which could be done better on the job. (7:70, 81)

Nationally there is a growing concern for a structure to integrate "industry" and "education" into a truly comprehensive national occupational training system. Gary B. Hansen has prepared for the National Manpower Task Force a report entitled, Britain's Industrial Training Act: Its History, Development and Implications for America.

Hansen points out "the dichotomy between formal education and institutional or on-the-job training remains unresolved in Britain, as indeed it does in the United States." He is of the opinion that the concept of the Industry Training Board, as used in the British training system, is worthy of consideration in this country. He cites implications in the British system for modifying the current U. S. training practices as follows:

> . . . such an approach might provide a suitable framework for overhauling America's archaic system of vocational education and training.
>
> . . . it could be a step toward fostering a healthy training consciousness in industry.
>
> . . . substantially modify the existing responsibility between institutional vocational education and industrial training within industry.

Problems to be met in the British training system are listed as follows:

. . . inadequate supply of training specialists and officers at all levels.

. . . problems of small firms with limited or highly specialized operations. (5:9, 54, 55)

A limited review of the literature reveals evidence that public education can be of greatest assistance to business-industry by providing students with basic job entry skills and the necessary educational background that will facilitate occupational advancement and mobility. Business-industry accepts the fact that they must train the new employee who possesses adequate entry skills in the application of those skills to specific work in progress. The policy of promotion from within necessitates in-plant training especially in the specialized skill areas.

SECTION III

METHODOLOGY

To accomplish the purposes of the study, the following methodology was used: (a) limited interviewing of business-industry personnel; (b) contact with a broad spectrum of business-industry via mail questionnaire; (c) analysis and interpretation of inquiry keyed to the questionnaire; (d) review of relevant literature in the field of business-industry occupational training programs; (e) development of conclusions and implications from the study.

Establishment of the sample for Phase I - Personal Interviews.

1. The Department of Labor drawing upon classified lists of business-industry organizations reporting in-plant education programs prepared and mailed letters encouraging cooperation in the proposed study. Recipients of the letter were requested to contact the authors. A total of 60 letters were mailed out.

2. Twenty five (25) business-industry organizations responded by phone and subsequent on-site interviews were arranged.

3. To provide a more representative sample, five additional organizations not responding but known to have training programs were contacted by the authors and included in the survey.

Seven organizations requested that contact be made with factoring agencies thereby reducing the on-site interview sample to twenty three (23).

Background was developed by visiting with vocational-technical educators and with several organizations concerned with manpower development. Pre-survey contacts were made with two business-industry organizations conducting in-plant training. From these contacts the questioning required to achieve the objectives of the study was delineated. Questions were then edited into an instrument which was used as the "questionnaire." For the purposes of the study, it was determined that the interview would be unstructured placing primary emphasis on the subject's verbal report.

Content of guide questions.

Guide questions were concerned with the following general areas: (a) general data; (b) what was happening in business-industry occupational education programs; (c) why did the situation exist; (d) what were the expectations for public education; (e) apparent trends in training concepts.

Establishment of the sample for Phase II - Mail Questionnaire.

1. The Chamber of Commerce of Hawaii made available to the authors the master mailing list of the organization. Questionnaires accompanied by an introductory letter and return envelope were mailed to 1,684 individuals and organizations in the State. The questionnaire was identical to that established in Phase I of the study.

2. Recipients were requested to return the completed questionnaires to the Hawaii RCU.

The data provided by respondents were organized and summarized for reporting purposes. As the study was not of a statistical design, the

findings were reported in a narrative discussion. Conclusions and implications were developed from the data collected.

SECTION IV

PRESENTATION OF FINDINGS

PHASE I - Interviews with Large Employers.

This section is devoted to a presentation of information and data gathered as a result of personal interviews with personnel directors, industrial relations officers and training staff of twenty three (23) business-industry organizations on the island of Oahu.

Several tables present tabulated data on certain aspects of the study; however, the research did not lend itself to a statistical study and findings are primarily reported by a narrative discussion.

The sample represented a good cross section of major employers of the community which, for reporting purposes, have been grouped into the following broad, general categories:

1. Sugar and Pineapple
2. Shipping
3. Manufacturing
4. Sales and Service
5. Labor/Management Associations
6. Banking
7. Public Utilities
8. Construction

Population sample.

TABLE 1

SAMPLE POPULATION DATA

Number Solicited	Number Interviewed	Total Employees Represented	Largest Payroll	Smallest Payroll	Average Payroll
60*	23	30,348	6,000	13	1,319

Note: Figures reported as estimates

*7 firms requested interviewers to contact the factoring agency

Only five organizations reported less than 250 employees. Therefore, the study does not reflect the concerns of the smaller organizations in the community.

Data indicate that females represent 10 percent of the total number of employees reported.

Extent of training conducted in business-industry.

Personnel managers, industrial relations officers and training staff were asked to respond to questions concerned with the amount of training being conducted, which is reflected in Table 2.

Responses on Table 2 indicate that with two exceptions all firms and organizations conduct training programs. All reported plans to expand present training or initiate a training program if they do not already have one. It was common practice to staff in-plant training programs with qualified personnel.

TABLE 2

SUMMARY OF RESPONSE TO QUESTIONS
REGARDING EXTENT OF TRAINING

Groups in Population	Number in Population	Conduct Training Program	Plan Expansion	Employ Trainer
Sugar/Pineapple	5	5	5	5
Shipping	1	1	1	1
Manufacturing	3	2	3	1
Sales/Service	6	6	6	5
Labor/Management Associations	2	2	2	2
Banking	1	1	1	1
Public Utilities	3	3	3	2
Construction	2	1	2	1
Totals	23	21	23	18

Representatives of the Contractors' Association were concerned as to how they were to meet training demands now facing them. Representing over 6,000 employees in a variety of trades, association administrators must shortly provide programs to up-grade employees as well as provide on-going programs to keep the present work force current with new techniques and processes in the construction industry.

A spokesman for one of the large sugar factors indicated that the industry expected to lose 1/3 of the present work force in the next ten years by retirement. He saw a technological revolution in the sugar industry occurring within the next ten years and a need for trained manpower to meet the challenge. Old practices will disappear, and both the sugar industry and the schools must develop new programs to meet changing needs.

TABLE 3

PURPOSES FOR WHICH TRAINING WAS CONDUCTED

Groups in Population	Job Entry	Improved Performance	Technological Change	Supervisory Training
Sugar/Pineapple	2	5	4	5
Shipping	0	1	1	2
Manufacturing	1	2	1	3
Sales/Service	4	6	3	3
Labor/Management Association	2	2	2	1
Banking	1	1	1	1
Public Utilities	3	3	2	2
Construction	1	2	0	1
Totals	14	22	14	16

Reasons for providing training.

Table 3 presents a summary of responses to several questions regarding the purposes for which training was conducted.

Table 3 reveals that business-industry places the major emphasis on training programs needed to up-grade and improve on-the-job personnel in order to keep the existing work force current to change and able to cope with new situations and equipment.

Most respondents mentioned the need to develop the capabilities of the first line supervisor who was responsible for much of the on-the-job training within the industry.

There was general consensus that the primary concern of business-industry was that of development of personnel once they were "on-board." However, it was repeated frequently that business-industry was searching for "new hires" with good basic public school foundations upon which it can build.

Job entry training programs were limited to those firms in which the new worker had to perform specialized functions peculiar to the activity.

Types of training programs being conducted.

Respondents were asked to indicate the specific types of training programs being conducted. Their responses are shown in Table 4.

Respondents generally agreed that training objectives were best met by "company organized in-plant" training programs. Seventy five percent of business-industry organizations were actively engaged in formal organized training programs. This activity was supplemented, in most

cases, by generous subsidies in the form of payment of tuition to colleges and universities, books and supplies, costs of correspondence courses, and travel and per diem to institutes and workshops in California and other states.

TABLE 4

SUMMARY OF RESPONSES TO QUESTIONS REGARDING TYPES OF TRAINING PROGRAMS BEING CONDUCTED

Number in Population	Apprenticeship State/Federal	Company Organized In-plant	Work Study Program	Subsidized Out-of-plant Courses
23	7	18	3	21

Seven apprenticeship programs were reported, but these were representative of only a limited number of total trainees involved in business-industry training programs.

The concept of work-study was of interest to many of the respondents. Three organizations reported on-going work-study programs in cooperation with public education. A number of the respondents indicated the need for business-industry to explore this avenue of training further.

An attempt was made to determine what qualifications, if any, business-industry had set as entrance requirements into training programs. Response was most varied and there was no general pattern throughout business-industry. Sixty percent used a proficiency test to screen and

determine abilities. In general, school certificates and diplomas were of little interest to employers other than as an indication of age and maturity.

Training programs, for the most part, were concerned with the development of skills related to trades and technical services. Respondents did not report training in the areas of office occupations.

Expectations for public education.

Respondents were given the opportunity to indicate services the public schools could perform or initiate in assuming responsibility for the development of manpower. Tables 5 and 6 reflect opinions in this regard.

TABLE 5

TRAINING AREAS SCHOOLS CAN BE OF MORE ASSISTANCE TO BUSINESS-INDUSTRY

Number in Population	Courses in Communication Skills	Courses Clerical Skills	Courses New Technologies	Courses Related Trade Skills
23	9	1	13	13

Table 5 reveals that business-industry is concerned with the need for courses to meet the changing technologies industry is now facing. Courses related to increasing on-the-job performance of workers in the skilled trades were considered equally important.

TABLE 6

SUGGESTIONS FOR INNOVATION AND CHANGE

Number in Population	Expand H.S. Voc. Program	Expand C.C.S. Program	Develop Work Study Program	Expand Part time Program
23	2	13	9	16

Table 6 reveals that business-industry identifies the evening and part-time programs as the area in which the public school can be of the greatest service; and, that expansion of such programs could supplement and even assume some of the training now being done by business-industry.

The community colleges and technical schools were seen as the educational level at which the schools could be of greatest help. Employees are adults and could be accommodated best in the post-high school programs.

The high school was rarely mentioned as a source of help in supplementary training. However, respondents were almost unanimous in their demands that "new hires" be adept in communication skills and oriented toward the world of work. The need for the development of better occupational counseling was frequently suggested.

Fifty percent of the respondents requested the services of the vocational teacher training staff at the University of Hawaii to assist business-industry in improving and developing in-plant training programs.

Cost of training programs and number of trainees involved.

Interviewing failed to determine the cost of training being incurred by business-industry. Respondents did not have figures and apparently such data was not readily available. Most respondents provided a "did not know" answer. Several of the large firms did, however, venture estimates which ranged from $25,000 to $100,000 for annual training costs.

The number of trainees receiving training annually was also impossible to determine. Programs varied from a few days to several years. Records were not available. A consensus of several of the respondents was that a figure representing 20 percent of the work force being trained at any one time was a good estimate.

PHASE II - Mail Survey of Small Employers.

This section is devoted to a presentation of information gathered as a result of the mail questionnaire survey of business-industry organizations on the island of Oahu.

Several tables present data tabulated for brevity and clarity of specific aspects of the study. The research did not lend itself to a statistical study and findings are primarily reported by a narrative discussion.

Occupational categories reported by responding employers were reduced to eleven principal categories for practicality in handling by combining closely related occupations. It should be noted that this arrangement is somewhat superficial as there are many overlapping areas and only the principal occupation of the business-industry firm reported was used in the occupational classification.

It was not practical from the information provided by the questionnaire to relate the occupational activity reported to the Department of Labor and Industrial Relations coding system.

However, to provide a more meaningful report and interpretation of data, the following table representing the categories has been provided to enable readers to assess the population sample represented by respondents.

TABLE 7

NUMBER OF EMPLOYEES REPORTED BY OCCUPATIONAL GROUPING

TOTAL EMPLOYEES REPORTED	20,336		
Occupational Grouping	Number Respondents (N)	Number Employees	Percent of Total Employees Reported
Sales and Service	89	3,379	16.6
Hotel and Restaurant	9	4,152	20.4
Mechanical	9	2,071	10.1
Manufacturing	20	1,966	8.7
Technical	17	1,977	9.6
Medical and Health	4	820	4.2
Clerical and Finance	55	4,031	19.8
Construction	24	1,578	7.7
Travel	6	161	.9
Printing and Publishing	5	156	.8
Other	6	245	1.2
	242	20,336	100.0%

Only those who responded to one or more items in each section area were included in the percentage calculations. These percentages are reflected in Tables 8 and 9.

Purpose and nature of training.

Respondents were asked the purpose for which in-service training was being provided. The answers are detailed in Table 8.

The most frequently reported reason for training was that of "improved performance." With minor exceptions all respondents listed this as the prime reason for training. To provide "job entry skills" was reported as the second most frequent reason for training.

Types of training programs.

Respondents overwhelmingly named "company organized and sponsored" as the principal type of training activity. Few organized formal and informal apprenticeship programs were reported. Major exception to this was the construction industry which reported apprenticeship as the major vehicle for training.

Evidence required to qualify for training programs.

An effort was made to identify the experience and educational attainment requirement, if any, for entry into training programs as established by respondents in the eleven categories. Table 8 provides a detailed summary of responses.

Responses of business-industry, reported by the eleven categories, most frequently listed a "statement of experience" as the most important entry requirement. This was followed by the need of evidence of a "school certificate" (unidentified). A review of item responses indicates a wide variety of entry requirements.

An inference can be drawn that because of the variety of activities of business-industry, there is little agreement from organization to organization as to standards for entry into training programs. The

TABLE 8

SUMMARY OF RESPONSES TO QUESTIONS REGARDING THE PURPOSES AND THE NATURE OF TRAINING PROGRAMS BEING CONDUCTED AND THE CRITERIA FOR THE SELECTION OF TRAINEES

Note: % reported is the percentage of responses only as related to the particular section.	Respondents identified by major job classifications										
Number of responses = (N)	Sales and Service	Hotel and Restaurant	Mechanical	Technical	Manufacturing	Medical and Health	Clerical and Finance	Construction	Travel	Printing and Publishing	Other
Total responses = 253	90	10	11	17	22	4	58	24	6	5	6
Average %	%	%	%	%	%	%	%	%	%	%	%
Purpose for which training is provided:											
Job entry skills	66	58	71	60	36	70	100	61	50	50	67	100
Improved performance	75	71	86	60	73	90	100	90	75	75	100	0
Changing technology	42	31	14	30	36	40	100	40	25	75	67	0
Supervisory and management	44	44	57	20	36	60	0	61	25	75	100	0
Type of training programs being conducted:											
Apprenticeship - Federal/State	22	6	20	10	9	0	0	7	79	0	50	0
Company organized and sponsored	84	94	50	100	82	80	100	92	26	100	100	100
Cooperative school-industry	21	13	0	30	0	30	100	25	11	0	25	0
Requirements for entry into training programs:											
None	29	31	33	30	15	44	50	22	30	20	30	17
School certificate	32	28	0	30	46	13	50	51	25	20	66	35
Statement of proficiency	54	58	16	60	54	38	100	43	55	80	33	17
Proficiency test	28	31	8	20	46	31	0	53	15	40	0	0

eleven categories provided responses from "0" percent to "100" percent to any one question. It is also significant to note that an average of 29 percent of business-industry respondents reported "no entry requirement."

Instructional areas in which business-industry feels public education could be of greater assistance.

When asked if the schools could provide training now being provided by business-industry, 143 of 253 firms responding (56.2%) indicated that "some" could be provided just as easily in the schools. Only 20 (8%) indicated that "all" training now being provided by the firm could be accomplished in the school.

The importance industry attached to the general areas of training that should be provided by the schools is shown in Table 9. Of the four program areas, data indicate that business-industry feels that the schools could be of greatest assistance in the development of "communication skills" for potential employees. The construction, mechanical and technical industries were exceptions to the above since they considered "courses related to skill areas" more important. "Clerical skills" and "new technologies" followed in that order with no significant preference indicated.

Expansion and development of public education programs that can best assist business-industry.

Business-industry was queried as to opinions regarding the program areas the schools could expand to serve their needs more fully. One hundred forty eight respondents identified "evening and part-time"

TABLE 9

SUMMARY OF RESPONSES TO QUESTIONS REGARDING THE PURPOSES AND THE NATURE OF TRAINING PROGRAMS BEING CONDUCTED AND THE CRITERIA FOR THE SELECTION OF TRAINEES

Note: % reported is the percentage of responses only as related to the particular section.	Respondents identified by major job classification										
Number of responses = (N) Total responses = 253	Sales and Service	Hotel and Restaurant	Mechanical	Technical	Manufacturing	Medical and Health	Clerical and Finance	Construction	Travel	Printing and Publishing	Other
	90	10	11	17	22	4	58	24	6	5	6
Average %	%	%	%	%	%	%	%	%	%	%	%
In what educational program areas do you think schools can be of more assistance to your organization:											
Courses in communication skills	67	81	77	50	40	72	75	85	28	66	100	66
Courses to improve clerical skills	38	40	22	10	7	28	75	44	9	66	60	33
Courses related to new technologies	27	28	21	60	46	17	25	23	18	18	20	17
Courses related to skill areas	40	23	21	60	87	28	0	25	90	33	60	17
How can the schools best assist business-industry training programs:											
Expanding vocational programs at the high school level	36	28	10	60	40	65	25	36	60	16	40	20
Expanding vocational-technical programs at the post-high school level	53	46	20	70	80	50	50	45	45	50	60	60
Development of work-study programs in cooperation with business-industry	34	34	80	30	20	25	0	30	20	50	60	20
Expand evening part-time programs to meet special needs at all levels	56	57	40	40	66	50	100	65	48	33	60	60

programs as a program area where the school could be of the greatest assistance. Respondents indicated priorities in this decending order:

(148) 51% favored "evening and part-time" programs

(121) 47% favored expanding vocational-technical programs at the post-high school level

(108) 33.5% favored expanding vocational-technical programs at the high school level

(86) 30.8% favored expanding work study programs

Respondents were encouraged to check one or more of the four items. It is significant to note that 38 percent indicated only one choice; 39 percent indicated two choices. An inference can be made that business-industry sees the need for program expansion in more than one area with preferences as indicated.

Assistance of "vocational teacher trainer" in developing training competencies.

Responses to the inquiry regarding assistance with training programs which professional educators might be able to provide business-industry indicated that such assistance would be most welcome.

One hundred four (60% of the total respondents to this question) indicated that the University's vocational teacher development programs could provide assistance to supervisors and others responsible for conducting in-service training. Table 10, Column 1 reports the responses.

Subsidizing of employees to encourage further education.

The survey undertook to determine the extent business-industry supplements "in-house" training programs by subsidizing and in other ways encouraging employees to take advantage of on-going, organized educational

TABLE 10

EMPLOYERS' RESPONSES CONCERNING EXPANDING TRAINING PROGRAMS, SUBSIDIZING EMPLOYEES IN TRAINING AND DEVELOPMENT OF TRAINING COMPETENCIES

	#1 Require assistance of vocational teacher trainer in developing training competencies			#2 Subsidize employees who are engaged in training courses			#3 Anticipated need to expand training programs

*NR - No response

programs being provided by colleges, institutes, universities, and correspondence courses.

Table 10, Column 2, reveals that 65 percent of the employers responding to this question subsidized further job related education for employees; 35 percent indicated that they did not.

Anticipated need to expand training programs.

Training activities of business-industry apparently will become more extensive as indicated by the data reported in Table 10, Column 3. One hundred thirty six firms (53% of the total respondents) indicated a need to increase training activities.

Training personnel and facilities costs.

One of the purposes of the survey was to evaluate the extent of training being conducted by business and industry. The questionnaire failed to determine specific numbers being trained and costs incurred.

One hundred fifty five of the 253 respondents reported 4,361 employees being serviced by in-plant training programs. Respondents listed 76 full-time trainers and 300 part-time trainers. Questions concerned with personnel and facilities, however, were only partially completed. Several answered by a question mark (?). One respondent answering in this manner represented a large hotel operation. Many others indicated "no training" but entered remarks such as the following:

> . . . it's hard to determine the number of employees receiving training
>
> . . . applicants are hired with no experience and given on-the-job training by the department to which they are assigned
>
> . . . we send employees to work shops and seminars
>
> . . . on-the-job training works best with us

SECTION V

CONCLUSIONS

The results of this survey appear to justify the following conclusions:

1. Business-industry is committed to a practice of promoting from within, and the primary concern is with in-plant training programs designed to increase the efficiency, productivity and skills of current employees.

2. Business-industry is interested in the public schools developing broad concepts and understanding as well as preemployment skills upon which training programs can be built.

3. The major implication for public education is in the provision of extended day, evening part-time and cooperative work study programs related to the needs of industry's employees.

4. Technological change in industrial materials and processes necessitates specialized training that cannot be anticipated for inclusion in the current curricula; therefore, it becomes the responsibility of business-industry either to conduct such training independently or to develop cooperative type programs with public education.

5. The local system of State sponsored apprenticeship can meet only certain manpower requirements because of the limited number of apprentice-type occupations currently in existence.

6. Business-industry is concerned with the lack of communication with vocational-technical educators.

7. There is little knowledge as to the cost-effectiveness of in-plant and other subsidized training programs of business-industry.

8. Business-industry is not concerned with in-plant training in clerical and secretarial skills; it, therefore, can be concluded that the high schools, community colleges, and other institutions are providing adequate training to meet the demands in these areas.

9. Present company organized and sponsored training programs could meet the needs of business-industry more effectively if there were more training coordination with vocational-technical programs of public schools, thereby relieving business-industry of some of the responsibility.

10. Business-industry widely subsidizes the educational development of employees by tuition refund programs, released time and related costs.

Comparative findings of PHASE I and PHASE II.

Since the sample surveyed in Phase I differed in some respects from the sample surveyed in Phase II, it was necessary to examine the data for any significant differences in findings. A comparison of the responses of Phase I (personal interview large employers) and Phase II (mail survey small employers) indicates that the conclusions drawn were consistent with only a few exceptions. (See Table 11.)

The following significant difference in conclusions can be drawn from Phase II of the survey which generally represented the smaller employer (78% less than 50 employees).

1. Courses in communication skills and the improvement of clerical skills were identified as course areas where public education could be of greatest assistance.

2. Expansion of vocational education at the high school level was reported as being significantly important as a means of assisting business-industry with training as well as expansion at the post-high school level.

3. "Statement of experience" was indicated as the most important requirement for entry into training programs. The "proficiency test" and the "school certificate" were not as significant as reported in Phase I.

4. Respondents were less optimistic regarding the need to expand training programs.

TABLE 11

COMPARISON OF DATA REPORTED BY RESPONDENTS PHASE I - PHASE II

	PHASE I Interview	PHASE II Mail Survey
	%	%
Purpose for which training is provided:		
Job entry skills	60	66
Improved performance	96	76
Changing technology	60	40
Supervisory and management	70	44
Type of training programs being conducted:		
Apprenticeship	30	22
Company organized and sponsored	78	84
Cooperative school-industry (work study)	13	21
Requirement for entry into training programs:		
None	26	29
School certificate	52	32
Statement of experience	21	54
Proficiency test	65	28
Instructional areas in which public education can be of greater assistance to business-industry:		
Course to improve communication skills	39	67
Course to improve clerical skills	4	38
Course related to new technologies	57	27
Course related to skilled trade area	57	40
Program areas public education can best assist business-industry training programs:		
Expanding vocational programs at the high school level	9	36
Expanding vocational-technical programs at the post-high school level	57	53
Development of work study programs in cooperation with business-industry	39	34
Evening part-time programs to meet special needs at all levels	70	56
Require assistance of "vocational teacher educator" to develop training competencies	52	41
Subsidize employees to acquire additional education	52	65
Anticipate expansion of in-plant training programs	87	54

APPENDIX A

SELECTED COMMENTS OF BUSINESS AND INDUSTRY IN RESPONSE TO QUERIES

Several comments made by respondents are appropriate for inclusion. In paraphrasing ideas and concepts, the following generalizations have been drawn:

Sugar and Pineapple Industry.

If related instruction for skilled trainees is not made available, we will need help in administering correspondence courses now being used.

Plantations should be surveyed to identify isolated training needs which could be accommodated in a central location.

We have a problem in recruiting new workers who have potential for progress to journeyman rating.

For my money, the program developed by the Maui Technical School jointly with the sugar industry 15 years ago has never been equalled--we need more of this cooperative activity.

In addition to traditional skills, training in new programs is needed to meet current demands.

Utilities.

Prospective employees are handicapped by deficiencies in numerical and verbal skills.

Off-campus evening programs are handicapped because of lack of instructional assistance.

Shipping.

We want a continuous flow of information on course offerings at the community colleges.

Current evening programs at Honolulu Community College are of great value to us.

Sales and Service.

New products and new materials mandate that we provide specialized training. Schools cannot keep training current.

I am presently working with the staff of the Honolulu Community College in developing a work-study program for qualified students in TV service.

The concept of DECA programs is good, but I find that students are not career oriented.

Labor and Management Association.

Our immediate problem is to up-grade labor grade employees to skilled classification.

We need more communication with the schools.

The industry has much to offer and we would like to work with school counselors and guidance personnel.

Apprentice courses need to be coordinated with the apprentice's on-the-job assignment.

Banking.

Training is so important to us that each employee is in a training situation and receives an average of one hour per week.

Manufacturing.

Help is needed in increasing the effectiveness of our first line supervisors.

Construction.

We appreciate this contact with you and hope that we can work together in coordinating training programs.

COPY OF LETTER SENT TO EMPLOYERS

SURVEY QUESTIONNAIRE

PHASE II

UNIVERSITY OF HAWAII

Hawaii Vocational Education Research Coordinating Unit
Community College System

November 3, 1967

Gentlemen:

We want to improve the services of the vocational-technical education programs presently being offered by the public schools of Hawaii in meeting community needs. Educators are aware that business-industry is engaged in extensive training programs. However, the nature of these programs and some of the reasons for doing so are not well known.

You are being asked to contribute to research designed to improve programs of vocational-technical education by completing the enclosed questionnaire. Specifics are not necessary--opinions and answers at hand will suffice.

From the information obtained, it is hoped that improved coordination between the school and industry can be developed in meeting manpower needs. Identification of your organization to specific information reported will not occur.

Return of the questionnaire in the enclosed envelope at your earliest convenience will be appreciated.

Sincerely yours,

Hawaii RCU

Hawaii Vocational Education Research Coordinating Unit
in cooperation with State Commission on Manpower and Full Employment

Community College System
2327 Dole Street, Honolulu, Hawaii 96822
Phone: 941-0966

INSTRUCTIONS:

1. You are being asked to participate in a survey of occupational training and facilities being provided by business-industry in Hawaii.
2. Please complete this form to provide information as to the type of training being provided your employees by organized class instruction, organized instruction on the job, supervisory training programs and subsidized workshops, institutes and evening classes.
3. Answer all questions. Use guesstimates if specific information is not available.

PART I GENERAL INFORMATION

1. Name of firm, institution or agency	2. Address
3. Name of person reporting	4. Title
5. Type of organization (Government, Utility, Retail, Trade, Hotel/Restaurant, Construction, etc.)	6. Number of Employees Total: Male % Female %

PART II TRAINING INFORMATION (If you have no program, please enter NONE and complete only applicable questions.)

Instructions: Indicate the general job classifications for which your organization is providing employee training.
Example: clerical, mechanical, technical, operators, service, supervisory, sales, construction, health, security, custodial.

1. Job classification

_____

2. Purpose for which training is being provided: (Check one or more)
   - 2.1 ____ Job entry skills (to 6 months)
   - 2.2 ____ Improved performance
   - 2.3 ____ Changing technology
   - 2.4 ____ Supervisory and management

3. Type of training program being conducted:
   - 3.1 ____ Apprenticeship -- Federal/State programs
   - 3.2 ____ Company organized and sponsored
   - 3.3 ____ Cooperative school-industry (work-study programs)

4. What evidence of qualification is required by your organization when selecting employees for training?
   - 4.1 ____ None
   - 4.2 ____ School certf/degree
   - 4.3 ____ Statement of experience
   - 4.4 ____ Proficiency test

   Identify any special academic proficiencies required:

   _____

5. In what educational program areas do you think schools can be of more assistance to your organization? (Check one or more)
   - ____ Communication skills: reading, writing, speaking
   - ____ Courses to improve clerical skills: typing, shorthand, etc.
   - ____ Courses related to new technologies
   - ____ Courses related to skill areas: layout, blue print reading, related math, etc.

6. Can the University's vocational teacher development program provide assistance to supervisors and others conducting training programs by workshops and courses in teaching techniques?

   ____ YES ____ NO

7. Do you subsidize and encourage individual employees in acquiring additional education?

   ____ YES ____ NO

   If YES, explain (ICS-University-Community College-Technical School)

8. Do you think that your future needs will require you to expand your present training program; or, initiate a training program if you do not already have one?

   ____ YES ____ NO

9. Has anyone from the schools' vocational-technical education programs talked with you recently to see if they could serve your needs better?

   ____ YES ____ NO

10. Could any or all of the kind of training you are providing be provided just as easily in the schools?
    - 10.1 ____ ALL
    - 10.2 ____ NONE
    - 10.3 ____ SOME

11. In your opinion, how can the schools best assist industry-business training. (Check one or more of the following possibilities)
    - 11.1 ____ Expanding vocational programs at the high school level
    - 11.2 ____ Expanding vocational-technical programs at the post-high school level (community college/technical schools)
    - 11.3 ____ Development of work-study programs in a cooperative industry-school training program
    - 11.4 ____ Evening, part-time programs to meet special needs at all levels

PART III FACILITIES-COSTS

1. What is the approximate number of employees receiving training annually?

   _____

2. Do you have room space specifically assigned and used for employee training?

   ____ YES ____ NO ____ OTHER

3. Do you have training aids to support the training program such as books, projectors, film, etc.?

   ____ YES ____ NO

4. What do you estimate the dollar value of your training facilities?

   (Under-5,000) (5,000-50,000) (50,000-Up)

5. Do you have personnel specifically assigned to conduct company sponsored training programs?

   ____ YES ____ NO

6. If company personnel are assigned to training, indicate the number.
   - ____ Number of staff assigned full time
   - ____ Number of staff assigned on part-time basis

7. What do you estimate your costs in training personnel annually?

   (Under 5,000) (5,000-25,000) (25,000-50,000) (50,000+)

SIGNIFICANT JOB SUCCESS FACTORS FOUND IN WORK-STUDY PROGRAMS IN FIVE MAJOR NEW YORK STATE CITIES

An Abstract

The University of the State of New York
THE STATE EDUCATION DEPARTMENT
Bureau of Occupational Education Research
Albany, New York 12224

January 1968

FOREWORD

This is an abstract prepared by the staff of the Bureau of Occupational Education Research, New York State's Research Coordinating Unit (R.C.U.) from a report financed by the Department under the Vocational Education Act of 1963.

The study was designed to direct the attention of administrators and teachers to certain factors involved in the success of the Work-Study Program in New York State.

The abstract is meant to convey to the teacher, supervisor, and administrator the study's implications and interpretations for direct application to today's school environment in planning work-study programs.

A copy of the entire New York State Study is available on a loan basis, by writing to the New York State Education Department, Bureau of Occupational Education Research, Albany, New York 12224.

Carl E. Wedekind
Director

ABSTRACT

SIGNIFICANT JOB SUCCESS FACTORS FOUND IN WORK-STUDY PROGRAMS IN FIVE MAJOR NEW YORK STATE CITIES

INTRODUCTION

The Vocational Education Act of 1963 required that the programs initiated by its funds be evaluated. Section 13 of this Act is the Work-Study portion, the intent of which is to provide work experience for secondary school students between the ages of 15 and 21 who are in need of earnings to commence, continue, or return to a full-time vocational education program. The Bureau of Occupational Education Research funded the School of Education at Syracuse University to conduct an evaluation of New York State Vocational Work-Study Programs operating under the Vocational Education Act of 1963.

The initial Vocational Work-Study Programs in New York State were started in January 1965 and a historical summary of these programs may be found in Appendix A. It was the intent of this study that evaluation of such work-study projects would measure the relative merits of programs and allow for a better understanding of what criteria are present in programs that are successful.

METHODOLOGY

This study was constructed so as to identify aspects of the work-study program that seem to be most closely related to job success among 246 senior students randomly selected from the graduating seniors in June 1966 from five urban school districts; namely, New York, Rochester, Schenectady, Syracuse, and Yonkers. The sample was equated for boys and girls to reduce variations due solely to sex differences. An attempt was made to determine whether the programs having higher ratings on five variables placed the graduates in correspondingly better job situations. The variables surveyed were:

1. The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program;

2. The students' grade point averages;

3. The number of hours of counseling;

4. The administrators' salaries;

5. Assignment of students to work-study job stations relating to students' major field.

These variables were then related to four job success factors:

1. The D.O.T. classification of graduates' jobs;

2. The proportion of students' available time actually employed after graduation;

3. The students' actual job held upon graduation and students' actual job potential as measured by standardized intelligence test scores; and

4. The job salaries of program graduates.

These variables and factors were constructed as twenty working hypotheses to be used to determine the relationship between graduates' economic efficiency level after graduation, and participation in the Vocational Work-Study Program by the graduates while students. Appropriate statistical techniques were used on these hypotheses with significant correlations noted in seven cases, a trend toward significance in five cases, and little or no significance in the remaining eight cases.

Three questionnaires were used to gather data: (1) the Program Descriptive Factor Sheet, (2) the Student History Form Section A, and (3) the Student History Form Section B. The Program Descriptive Factor Sheet contains information relative to specific school district programs during the 1965-66 academic year. The Student History Form Section A contains data regarding the graduate's high school record and post-school employment. The Student History Form Section B contains respondent's personal data such as achievement tests reports, intelligence tests results, anecdotal records, absenteeism, grades, number of counseling hours received, and types of school program. The questionnaires were pretested in a pilot program, revised, and shown to be reliable.

SUMMARY

Significant correlations were noted between the students' grade point averages and the D.O.T. classification of graduates' jobs, the proportion of students' time actually employed after graduation, and the difference between the actual job held after graduation and students' actual job potential. Significant correlations were also found in the relationship of assignment of students to work-study job stations related to their major field and the students' D.O.T. classification, actual time employed, actual job vs. actual job potential, and job salaries of program graduates.

A trend toward significance was noted between the number of hours of counseling and the four variables related to job success factors. A low, but positive relationship between the proportion of work-study administrators and supervisors to the number of students in the program and the students' actual job held upon graduation and students' actual job potential was recorded.

No significant trends could be noted between the proportion of work-study administrators and supervisors to students with regard to D.O.T. level of graduates job, proportion of time students were employed, and the job salaries of program graduates. There was also no significance shown by correlation when the administrators' salaries is related to each of the four variables.

CONCLUSIONS

The more successful the student in his school work, the higher success rating he received on his job. The closer the correspondence between job skills learned by the graduates while they were in the work-study programs with the skills required for their jobs after graduation, the higher order of success they experienced in employment. In light of this, the following suggestions are made:

1. A greater percentage of the Federal monies should be spent for occupational guidance and counseling.

2. The use of local advisory committees, e.g., that which is proffered in Youth Work-Study Program,[1] should be further encouraged.

3. There should exist "orientation" sessions, for school work-study supervisors, counselors, vocational and technical instructors, and appropriate officials of the State Education Department, so that program integrity is the result of concerted effort.

4. Specialists, representatives of various disciplines and vocations should meet periodically to question openly whether the current vocational and technical curricula are equal to demands in a changing world of work. While it is true that, ". . .schools pride themselves on how close their shop facilities duplicate real job conditions . . ." according to Venn,". . .this does not necessarily mean that the school had given the graduate the education he may really need. What is called for is more and better occupational education, to be sure, but occupational education on more general basis--teaching certain basic skills, of course, but also devoting more time to the development of broader technical understanding of communication and computational abilities, and of an appreciation of civic, cultural, and leisure activities."[2]

---

1. Youth Work-Study Program, Summary and Suggested Development (Albany, N.Y.: The University of the State of New York, The State Education Department, Division of Special Occupational Services), p. 3.

2. Grant Venn, Man, Education and Work, Postsecondary Vocational Education (Washington: American Council on Education, 1964), p. 32.

STUDENT RESPONSES

The conclusion that the Vocational Work-Study Programs investigated in this study uphold the intent of the Vocational Education Act of 1963 is based in part on the following:

1. Approximately 76 per cent of the students sampled agreed that the program has helped them since graduation.

2. Approximately 79 per cent of the students sampled responded that they would tell a friend to go back to school for the Work-Study Program.

3. Approximately 94 per cent of the students sampled agreed that they liked the Work-Study Program while in school.

4. Approximately 80 per cent of the students sampled responded that they did better in their school work while in the program.

5. Approximately 76 per cent of the students sampled agreed that they enjoyed school more while in the Work-Study Program.

Of the 90 students who are eligible for employment:

6. Approximately 69 per cent of the students responded that they did have a job when they left school in June 1966, and an additional 12 per cent found jobs within 30 days after graduation.

7. Approximately 64 per cent of the students responded that they were working 31-40 hours per week and an additional 16 per cent responded that they worked over 40 hours per week.

8. Approximately 82 per cent of the students responded that they are earning more than $1.51 per hour. Thirty per cent responded that they are earning from $1.51 to $1.75 per hour, 26 per cent from $1.76 to $2.00 per hour, and 26 per cent earning over $2.00 per hour.

FUTURE RESEARCH

Lastly, additional research pertaining to the efficacy of Vocational Work-Study Programs is in order. Such reports should attempt to seek the answers to such questions as:

1. Are employers more satisfied with those high school students who participated in the Vocational Work-Study Programs as compared to other terminal high school students?

2. Has the "holding power" of those schools offering Vocational Work-Study Programs increased appreciably?

3. Have the skill levels of the Vocational Work-Study Program graduates improved significantly as a direct result of participating in the Vocational Work-Study Program?

4. What strengths and/or weaknesses are discernible in Vocational Work-Study Programs conducted in rural or consolidated school districts as opposed to the urban-operated programs?

5. What do periodic follow-up studies on participants of the Vocational Work-Study Programs reveal concerning their educational experiences?

APPENDIX A

NEW YORK STATE WORK-STUDY PROGRAM

From January 1965 to June 1967

From January 1965, when the Vocational Education Act of 1963 Work-Study Program started in New York State until the end of June 1967, a total of 25,519 students participated in part-time work experiences and received $4,374,355.73 in stipends. Of this total, 14,773 were males and 10,746 were females. The largest number of students being 17 to 18 year old males. (See Table I.)

TABLE I

THE AGE RANGE OF THE VOCATIONAL EDUCATION WORK-STUDY STUDENTS

Ages	Male	Female	Total
15 - 16	4,408	3,067	7,475
17 - 18	9,050	6,835	15,885
19 - 20	1,315	844	2,159
TOTAL	14,773	10,746	25,519

Over 13,000 students earned over $20 and less than $50 per month during the time they participated in the program. During the summer months, the students were not limited in their monthly earnings, consequently, they earned over the minimum rates stipulated in the law. (See Table II.)

TABLE II

THE EARNING RANGE OF THE VOCATIONAL EDUCATION WORK-STUDY STUDENTS

Earning Range	Male	Female	Total
Under $20/month	2,370	2,145	4,515
$20 to $44.99/month	7,316	5,723	13,039
$45 to $60/month	1,328	1,131	2,459
Over $60/month *	3,114	2,392	5,506
TOTAL	14,128	11,391	25,519

* Summer programs only

Approximately 66 per cent of the students worked in jobs related to their curriculum. (See Table III.)

TABLE III

NUMBER OF VOCATIONAL EDUCATION WORK-STUDY STUDENTS THAT WORKED IN JOBS RELATED TO THEIR CURRICULUM

Jobs	Male	Female	Total
Related	6,069	9,185	15,254
Non-related	8,704	1,561	10,265

It is interesting to note that every dollar received in New York State from Section 13 of the Vocational Education Act was allocated to student stipends. The administrative expenses, which amounted to approximately 11 per cent of the stipend allocations were from Section 4(a) of the Act. The largest single program occurred during the Summer of 1966 when over 1.6 million dollars was allocated to the students. The next largest program occurred during the academic year 1965-1966 when slightly over 1 million dollars was allocated to the students. (Table IV.)

TABLE IV

VOCATIONAL WORK-STUDY EXPENDITURES

Programs	Administrative Expenditures Section 4(a)	Stipend Expenditures Section 13
Academic year 1964-1965	$ 40,000.92	$ 405,000.00
Summer 1965	11,689.92	413,600.66
Academic year 1965-1966	208,539.55	1,074,572.47
Summer 1966	114,507.63	1,650,133.60
Academic year 1966-1967	101,241.09	827,049.00
TOTAL	$475,978.19	$4,374,355.73

At no time was any local program ever funded 100 per cent of their request. The largest percentage funded was 50 per cent during academic year 1964-1965, with the lowest percentage of 25 per cent funded during the academic year 1966-1967. This meant that of the approvable projects for the last New York State Work-Study Program, only ¼ of the amount requested by local agencies for student stipends was funded, with the balance coming from local effort, or else the Program was curtailed.

Because of the fact that Work-Study Programs were only funded at ¼ of the amount requested for the last fiscal year, it is estimated that under the present rules and regulations of the Vocational Education Act Work-Study Program, New York State could spend over 6 million dollars a year on student stipends.

WORKING WOMEN; *SOCIAL STATUS; *ROLE CONFLICT; LABOR LEGISLATION; *CONFERENCE REPORTS; SPEECHES; SOCIAL CHANGE; *FEMALES; EMPLOYMENT PATTERNS; SOCIAL PROBLEMS; *CULTURAL OPPORTUNITIES; CIVIL RIGHTS LEGISLATION NORTH DAKOTA; *CONFERENCE ON NEW HORIZONS FOR NORTH DAKOTA WOMEN, BISMARK, NORTH DAKOTA, JULY 17-18, 1964

The conference explored the circumstances under which women live, the problems they face, and ways to meet problems more effectively. Major addresses were given by Mrs. Esther Peterson, Assistant Secretary of Labor, and Mrs. Alice A. Morrison, Chief, Division of Legislation and Standards, Women's Bureau. Participants exchanged ideas and experiences during workshop discussions sponsored by (1) the education and home-community committees, (2) the public and private employment committees, and (3) the civil and political rights, social insurance and labor legislation committees. Mrs. Peterson related facts about the new life patterns of contemporary women including increased longevity, working wives, opportunities for continuing education, and expansion of community services for homemakers. She spoke of governmental programs affecting the status of women, and in conclusion, she challenged participants to make an intensive appraisal of women's role, rights and obligations in every phase of community life. Mrs. Morrison, speaking on state legislation of women's rights, observed that "the legal status of women is continually changing and improving, but some discriminations remain." She concluded that anti-discrimination efforts not only help women in this country, but set an example for the women of all nations. (FP)

FOREWORD

This report summarizes the conference on New Horizons for North Dakota Women held in Bismarck, North Dakota, July 17th and 18th, 1964. The conference was one of a series of State and regional meetings cosponsored by the Women's Bureau, U.S. Department of Labor, in a continuing effort to explore the circumstances under which women live, the problems they face, and ways of meeting these problems more effectively.

The conference on New Horizons for North Dakota Women was sponsored by the Governor's Commission on the Status of Women in cooperation with the North Dakota Department of Labor, the North Dakota State Employment Service, the North Dakota Unemployment Compensation Division, and the Women's Bureau. The conference was fortunate in having as participants men and women who represented a wide variety of groups--employees, employers, government, volunteer workers and organizations, education, and politics. It benefited also from the counsel of women who had had experience with similar lines of inquiry in neighboring States.

We acknowledge with great appreciation the tremendous contribution of the committees that organized the proceedings. The meeting provided not only stimulating informative sessions, but also opportunities for personal exchange of ideas and experience and for warm fellowship. Many thanks are extended to the panelists who encouraged discussion in the three workshops by presenting pertinent information.

The stimulation afforded by meetings such as this one and the action that so often follows encourage us to believe that a realistic picture of women's lives is becoming increasingly apparent and that improvements that need to be made will surely follow.

3:00 p.m. Tea - Governor's Residence

THE GOVERNOR'S MESSAGE

It is a great pleasure for me to extend greetings to you on this occasion of the "New Horizons for North Dakota Women" conference.

The Governor's Commission on the Status of Women was established along the lines set forth by President Kennedy to " . . . demolish prejudices and outmoded customs which act as barriers to the full partnership of women in our democracy."

I believe we are fortunate in that each year more and more women are taking an active role in the affairs of our State and Nation. This is as it should be, since we will always be in need of the best minds and talents available--the minds and talents of both men and women.

It is my hope that this conference will help alert us as to whether any "prejudices and outmoded customs" persist in North Dakota to the detriment of the common welfare and, if so, to assist us in eliminating all such vestiges of another era.

North Dakota is rapidly moving into a challenging and exciting new era. In order to meet these challenges, and seize these opportunities, your counsel and cooperation is not only needed; it is vital.

William L. Guy
Governor of North Dakota

88

CONFERENCE SESSIONS

Dinner Session, Friday, July 17, 1964

Miss Dagny Olson, Vice Chairman of the North Dakota Commission on the Status of Women, was chairman of the session. She called the meeting to order and introduced Monsignor William F. Garvin of the Holy Spirit Cathedral, who gave the invocation.

Miss Olson thanked Miss Gladys E. Wentland for the tremendous task she had accomplished in organizing the conference. Miss Wentland, in turn, gave credit to the members of the committees that had been responsible for planning conference activities.

Miss Olson then introduced the Mayor of Bismarck, the Honorable Evan E. Lips.

Mayor Lips commented on the fine and able women working in Bismarck, and noted that in some areas of education, government, industry, and business, their performance is sometimes superior to that of men.

The Honorable Frank A. Wenstrom, Lieutenant Governor of North Dakota, welcomed the conference and praised the women of North Dakota who "are playing an increasing and ever more important part in business enterprises and in all branches of State and local government." He paid special tribute to "those able, hard-working, enthusiastic women who have served the people of our State so devotedly as legislators throughout the year," and "our loyal and ever-dependable desk reporters, our stenos, and committee clerks, who, working together, make the operation of the legislature possible. They have brought to that assembly a rich background of experience and know-how."

On behalf of the Governor's Commission on the Status of Women, Miss Olson officially welcomed the conferees, recalling that local Business and Professional Women's Clubs and the American Association of University Women helped foster Governor Guy's interest in appointing a Commission on the Status of Women. She praised the Governor for his forward-looking attitudes, and complimented the State's lawmakers for the favorable laws that regulate the civil and political rights of North Dakota's women.

Miss Olson took her audience back into the history of North Dakota. She noted that in 1863 the Assembly of the Dakota Territory limited the working time of women and children in the mechanical and manufacturing industries to 10 hours a day. The limitation also applied to contracts concerning women that did not specify the number of working hours. Fines for violation of the act were to be earmarked for schools. It has been suggested that, since there were almost no people in the Territory actually protected by the law, its real purpose was to attract factory workers in eastern cities as settlers.

Bills to permit women's suffrage were introduced from time to time in the Territorial Assembly, but did not develop much interest.

At the convention called in 1889 to draft a constitution for the new State of North Dakota, two of the most difficult issues were child labor and women's suffrage. Although there was some support for a minimum age of 15 years for workers, the provision finally approved prohibited labor of children under 12 years in mines, factories, and workshops.

There was active lobbying in behalf of women's suffrage, but after 3 weeks the convention gave only a glimmer of hope to women when it approved Section 122: "The legislative assembly shall be empowered to make further extensions of suffrage hereafter, at its discretion, to all citizens of mature age and sound mind, not convicted of crime, without regard to sex; but no law extending or restricting the right of suffrage shall be in force until adopted by a majority of the electors of the state voting at a general election."

Miss Olson pointed out that this left the issue of women's franchise up to the electors, who, of course, were men. However, while women of North Dakota did not acquire the vote on most matters, the convention, on the 43d day, declared them equal citizens in regard to school elections when it approved Section 128: "Any woman having the qualifications enumerated in section 121 of this article as to age, residence and citizenship, and including those now qualified by the laws of the territory, may vote for all school officers, and upon all questions pertaining solely to school matters, and be eligible to any school office."

"This was how our legal rights began."

The speaker of the evening, Mrs. Esther Peterson, Assistant Secretary of Labor, was introduced by Mrs. Agnes Geelan, Chairman of the North Dakota Commission on the Status of Women, as a woman who embodied President Kennedy's aspirations for American women. The Executive order establishing the President's Commission on the Status of Women directed that it find ways to ". . . enable women to continue their role as wives and mothers while making a maximum contribution to the world around them."

"Our distinguished guest and speaker has made and is making that maximum contribution, "Mrs. Geelan said, "as Assistant Secretary of Labor, as former head of the Women's Bureau, as Special Assistant to the President for Consumer Affairs, as Executive Vice Chairman of the President's Commission on the Status of Women, as Vice Chairman of the interdepartmental committee that is implementing the recommendations of the Commission. She has made that contribution in a career of teaching, in a lifetime of service to the labor movement, and in a career in Government where she is doing more than any other person to advance the status of women. And with all that, Mrs. Peterson's office asked us to arrange her schedule so she could get back to Washington to spend Sunday with her family."

Mrs. Peterson expressed her appreciation to those who had invited her to come, explaining that she felt a great interest in North Dakota because it was her husband's State and she felt that it had helped mold him and make him the "best man there is."

Mrs. Peterson mentioned that she had just returned from a meeting of the International Labor Organization in Geneva, Switzerland, where the status of women had been discussed. There are many places in the world, she noted, where a meeting such as the one in progress could not possibly be held.

"We are so fortunate in this country of ours. We can be so thankful for the democratic principles, the ingrained sense of individual worth, and the pioneering spirit that underlie our national life.

"I suspect that you here in North Dakota, like people in my own State of Utah, have an abundance of that pioneering spirit. It was not so very long ago that our ancestors moved westward, pushing back frontiers, risking their lives and possessions to establish homesteads, build communities, and expand a Nation.

"An interesting thing about the days of expanding frontiers was that men and women enjoyed a very real partnership in the adventure of settling new lands. Women shared the hardships and triumphs of pioneer life. Their contribution to the economy of the community was considerable, for they produced the food and the clothing that the family required; they nursed the sick, took care of the aged, and instructed the young. They worked in the fields beside their men and even took up rifles to defend their homes.

"But the wilderness has been conquered. Supplying a home with the goods and services needed by a modern family has become a commercial venture, and women are seeking new ways to make their full contribution to the society in which they live. While the home and family are still a woman's primary responsibility, homemaking and child-rearing no longer occupy the whole of her lifetime.

"As a result, women's lives are falling into new patterns. Women marry young and complete their families within a short span of years--usually while they are still in

their twenties. The average woman today is in her early thirties when her last child enters school.

"Since the life expectancy of women has increased from 48 to over 73 years since the turn of the century, American women can look forward to 30 or 35 years of active life after their families are launched.

"Freed from overburdening home responsibilities, healthy and energetic, American women turn to activities outside the home, either in paid employment or in volunteer work. They are pioneering in new fields to make the second half of their lives meaningful and productive.

"The problems we must deal with today--problems involving human values and attitudes--are byproducts of rapid change. The attributes of the pioneer--determination, capacity for hard work, and willingness to sacrifice--are as needed today as they were in the days of the unexplored frontier. To meet our problems successfully, we must develop an intellectual ruggedness and the ability to translate ideas into action.

"The President of the United States has issued a special invitation to women to participate in the building of what he terms 'the Great Society.' As a result, American women enjoy unparalleled opportunity to exercise their wit and wisdom in order to give shape and substance to their devotion to justice and knowledge and beauty."

Mrs. Peterson suggested that the climate of opinion has never been more favorable to women than it is now. She reported an upsurge of interest in women's role in society in the wake of the activities of the President's Commission on the Status of Women.

As evidence, Mrs. Peterson cited distribution figures for the Commission's report, American Women. Some 32,500 copies were given away and 31,300 copies were sold by the Government Printing Office. Charles Scribner's Sons plans to reissue the report in hard cover and paperback editions, including additional background material and a commentary by anthropologist Margaret Mead. The report itself has been translated into Italian, German, and Japanese. In Denmark, a Commission on the Status of Women has been established. In the United States, a large majority of the Governors have established Commissions on the Status of Women, and these Commissions in turn have stimulated conferences, ideas, and action.

As one of his last official acts, President Kennedy set up the Interdepartmental Committee and the Citizens' Advisory Council on the Status of Women to promote implementation of the Commission's recommendations. These two groups have reported a great deal of progress toward the goals suggested by the Commission. Mrs. Peterson cited some of the gains: In the Federal civil service, hiring officials may no longer specify the sex of a worker they need to fill a job, unless sex has a direct bearing on the job to be done. President Johnson has told his Cabinet: "The day is over when the top jobs are reserved for men." Over a thousand women have been appointed or promoted to Federal jobs that pay more than $10,000.

In private employment, the principle of equal pay for equal work has been embodied in law with passage of the Federal Equal Pay Act of 1963. Tax deductions for child care have been liberalized.

"But," said Mrs. Peterson, "the establishment, of State commissions is perhaps the most significant result of the work of the President's Commission.

"We recognized from the beginning that action to implement many of the Commission's recommendations must start at the local level. The economic, legal, and social changes needed to improve the status of women cannot be brought about by Federal action alone.

"Increasing opportunities for continuing education, improvement of education in the schools, expansion of community services to homemakers, and the evaluation of community services, for instance, must be initiated at the local level.

"However, there are many areas where Federal and local forces can and must work together to achieve needed improvements. Grant-in-aid programs can stimulate local interest and action in such areas as job training, day care, and homemaker services, but the community must participate in the planning and in carrying out the plans.

"The Department of Health, Education, and Welfare is initiating some new programs which should be watched with interest. For example, projects have been established in

five States to test the effectiveness of concentrated services and incentives designed to encourage teenagers either to complete their schooling or to secure training or placement in a suitable vocation.

"The Commission put great stress on the need for more homemaker services, and we find the Welfare Administration of the Department of Health, Education, and Welfare experimenting in this field, with special emphasis on low-income families. In one such project in Wisconsin, women receiving aid to dependent children or general public assistance were given an opportunity to train as home management aides. Between January 1962 and June 1964, 152 women, trained to work with low-income families, were graduated from the course. Forty who found employment were able to manage without further welfare assistance.

"The Federal Government can help State legislatures formulate minimum wage and equal pay laws, protective labor legislation, education and child care laws, and similar measures. But concerned citizens must lobby for the passage of needed legislation.

"To make our society a great society we need not only partnership of men and women, but also full partnership between the Federal Government and the State governments, and full participation by all segments of our population.

"Your State Commission on the Status of Women can be a significant force in bringing about the cooperation and participation that is needed. Your influence will be reflected in the attitudes of the people of your State. It will determine to what extent opportunities for education, employment, and promotion are opened up to women. It will determine to what extent women will enjoy what we have come to consider a basic freedom: the freedom to choose how one will spend one's life; what contribution one will make to society.

"This desire to contribute to society draws many of us into activities outside the home--sometimes as volunteers in community projects, but more often as employed workers. The 63,163 women workers in North Dakota in 1960 represented a 34 percent increase since 1950 and a 59 percent increase since 1940. By 1970 we expect 80,000 women workers in your State, an increase of 27 percent from 1960. At the same time, the number of employed men is expected to decrease by 7.2 percent.

"Job opportunities change frequently these days. We no longer train for an occupation in our youth and do the same work for the rest of our lives. This is particularly true in agriculture where the number of farms and the demand for farm workers are rapidly diminishing. In 1963, 1 out of every 15 American workers worked on a farm; by 1975 we expect the ratio to be less than 1 out of every 20 workers.

"Such changes in basic industries mean that many adults must learn new skills; training facilities must be provided by the local community or by the Federal Government through such programs as the Manpower Training and Development Act and the Area Redevelopment Act. In 1963, 36 projects for 357 trainees were approved for North Dakota at a cost of $808,684.

"Changes in education for the young are also necessary. Today we feel that a high school education is minimal, but we have not always achieved even that goal. Statistics show that in 1960, 61 percent of the population of this State 25 years and older had had less than 4 years of high school. We must do better than this for today's young people. We are expecting them to enter the labor force in increasing numbers; during the decade of the sixties about 26 million new young workers will be seeking employment. We must see that they have the education and the skills to meet the demand for highly trained workers, for unskilled jobs are fast disappearing. We must impress upon our schoolgirls that they will probably work outside their homes at some time during their lives; 8 or 9 out of every 10 do. This means that their education and counseling must prepare them for a dual role in life. This is an area where a commission such as yours can exert strong influence.

"Poverty is a problem that concerns us all, not only because of the suffering it inflicts upon its victims, but also because it depresses the economy and holds back progress. Unless we can put more purchasing power into the hands of this Nation's 9.3 million families living on annual incomes of less than $3,000, our rate of production will lag as will our rate of employment.

"Here again your commission can help. This State's 43,000 families who lived on incomes under $3,000 in 1960 represented 29 percent of all families in North Dakota. Of these poor families, 23,000 had children under 18 years of age. There were 60,000 children being raised in poverty. Eleven percent of the State's poor families were headed by women.

"We tend to think that poverty is linked to unemployment, but the shocking truth is that nearly half the Nation's poor families in 1962 had one member who worked. About one-fifth had two members at work, and nearly one-half million families remained impoverished with three or more members employed.

"How can we help these working poor? The answer, I think, lies in better minimum wage laws. Even the Federal minimum of $1.25 an hour does not provide an employee who works 40 hours a week with enough salary to reach the $3,000 annual income that we consider the edge of poverty. What, then, of the State laws that call for no more than 50, 60, or 75 cents an hour?

"There are other areas in which your commision will want to work and can work most effectively. I have talked about basic education, but we also need to urge our women to seek higher education. The real need for workers today is in the professional and technical fields, yet I note a decline in the percent of North Dakota women workers in these occupations from 24 percent in 1940 to 17 percent in 1960. If we truly want to see women in policymaking jobs in government, in industry, and in the professions, then we must encourage them to prepare for these responsibilities. And we must not assume that a college education is wasted on women who choose to contribute to society by concentrating on home and family. In today's complex world, the more knowledge and developed talent a mother has, the more she will be able to contribute to the development and future success of her children.

"You will be interested, too, in the efforts we are making toward improving conditions faced by household workers. The Woman's Bureau sponsored a consultation on this subject in Washington recently with a group of interested agencies and organizations. There was strong conviction among most of those attending that women who wish to enter this field should be able to secure training and become specialists in the various homemaking skills, so that they can command better wages and enjoy the status of skilled workers. Employers would benefit by being able to hire competent skilled workers, such as cooks or mother's aides, on a part-time basis.

"I know you are interested in the needs of North Dakota's Indian population. Among these people, problems of education, unemployment, and poverty are acute. We are particularly concerned about the education of Indian children, because about half the Indian population of the country is under 20 years of age. This is indeed a challenge to us, for it is probably only through the education of these youngsters that we will break the cycle of poverty among these people.

"I hope that during this conference we will have time to examine some of the other problems to which we seek solutions. We should talk about the need for community services that will help women do a better job as mothers and homemakers, especially when they combine these roles with employment outside the home.

"I'm thinking particularly of day care facilities, not only to help working mothers, but also to help mothers with big families in little houses, to help mothers who are ill or disabled, and to help mothers who are catching up on their education or performing valuable volunteer services in the community. I have been so impressed by the day care services that have been developed in Sweden, Austria, and other European countries I have visited. The day care centers are not just places where children are watched and kept out of trouble while their mothers are busy elsewhere. They are places where the child is encouraged to develop as a person, where attention is paid to his individual needs, and where the atmosphere is one of affection and companionship. Every effort is made to foster the warm, loving relationship between mother and child that makes for a happy home. We have child care centers like this in our country, but not nearly enough.

"We also need to talk about women's role as citizens. It's important that women get into the mainstream of public life and participate in county, State, and National politics. We need qualified women in policymaking posts all down the line; it will be up to women

at the local level to urge public officials and political leaders to follow President Johnson's example in opening public office to women.

"Then there is the vast subject of the place of the volunteer in our society today. We have a new image of her. She is efficient, well educated, and well trained. Many of her jobs are administrative; many deserve professional status; all meet unfilled needs. How can we help the volunteer develop her potential and improve her status?

"You can see why I think commissions like yours are so important. You are in a position to make an intensive appraisal of women's role, rights, and obligations in every phase of community life. Through your meetings; your consultations with women's organizations, labor unions, and community groups; and your reports, you will bring the purposes and findings of the commission to the attention of thousands of citizens in every walk of life.

"You will find that the programs of women's groups--the Business and Professional Women's Clubs, the American Home Economics Association, the League of Women Voters, Pilot, Zonta, Soroptimist, and all the rest--will soon reflect your influence. You will find educators and social scientists on your side. You will find, too, that you will command respect and win friends in State and local legislative bodies.

"Best of all, your own lives will be enriched. You are in the midst of a wonderful experience. If at times it seems frustrating and difficult, I car assure you that overall it will prove most gratifying.

"The Interdepartmental Committee and the Citizens' Advisory Council are eager to help at the Federal level. We want to work with you, to share your experience, and to learn with and from you. That is why we will keep in touch with you and serve, if we may, as a clearinghouse for all the knowledge, experience, and information that is developing in State commissions throughout the country. We invite your suggestions, your ideas, and your cooperation. Please make it a two-way street."

Mrs. Peterson's address was followed by a "Hat and History Show"--a parade of hats displaying styles from 1896 to 1964. The show was written, directed, and staged by Mrs. Constance E. Sidell. Narration was interspersed with songs for which Mrs. Sidell had written special lyrics related to the theme of the conference.

Morning Session, Saturday, July 18, 1964

Mrs. Agnes Geelan called the meeting to order and asked the Reverend Hensel Hendrickson of Trinity Lutheran Church to give the invocation.

Mrs. Geelan explained a program change: Governor William L. Guy, who had planned to interrupt his vacation to greet the conference provided his vacation was "fairly undisturbed" by other emergencies, had just been able to return to his holiday after an emergency that brought him back to the capital the previous week. Mrs. Geelan and conference members were disappointed, but appreciated his interest and the message he sent to the conference, which is on page vi.

Mrs. Geelan, chairman of the Governor's Commission on the Status of Women since its inception in October 1963, recalled the assistance, guidance, and encouragement she received, since the beginning of her task, from Miss Marguerite I. Gilmore, Regional Director of the Women's Bureau, U.S. Department of Labor, and presented Miss Gilmore to the conference.

"It is a wonderful thing to see how a State like yours takes hold of an idea and develops it," Miss Gilmore said. "We hope to be able to use some of your experienced leaders to help us spread good ideas to some of the other State commissions. It is a great pleasure to be here and a greater one to see how far you have come in a short time."

Mrs. Alice A. Morrison, Chief of the Division of Legislation and Standards, Women's Bureau, also was introduced. Mrs. Morrison explained that she had graduated from both the Liberal Arts College and the Law School of the University of North Dakota and regarded the State as her legal residence for civil service purposes.

She pointed out that North Dakota had a very good start for a commission on the status of women because the State already had good laws pertaining to women's status.

"In 1938, when we published our first report on the civil and political status of women, 23 States excluded women from jury service. One State, Oklahoma, barred women from eight major or State offices. Fourteen States and the District of Columbia gave preference to the father in regard to custody of his children, their upbringing, discipline, and education.

"Six States placed restrictions on the wife's conveyance of her separate property that did not apply to the husband's property. In seven States women were barred from serving in a fiduciary capacity, such as executor, administrator, or guardian. In two of the eight community property States, a surviving husband was entitled to inherit more than a surviving wife. In seven States--and this is the only group that includes North Dakota--a husband had the legal right to claim his wife's earnings unless he had agreed she could receive them as her own property.

"The legal status of women is continually changing and improving, but some discriminations remain. At the present time, four States still allow women to be married at 14 years of age with the consent of their parents. Four States require court approval before the wife can engage in a separate business that does not pledge her husband's account or property.

"Three States still give the man the preference for service in suretyship or as guarantor. One State requires the husband to join in a suit involving his wife's separate

real property. With respect to domicile, only four States permit a woman to have a domicile separate from her husband's for all purposes. This sometimes causes inequities with respect to voting, jury service, public office, probate, and taxation.

"In the eight community property States the husband and the wife now have an equal estate, but in most of those States the husband has the right to control the property during marriage. Some States still restrict the wife's disposition of her separate property during marriage, but do not similarly restrict the husband's disposition.

"These more obvious inequities, you can see at a glance, cause men and women to be treated differently. The Committee on Civil and Political Rights of the President's Commission on the Status of Women was interested in basic rights. It was interested in the partnership principle of marriage and believed that husbands and wives each should have a tangible, legal right in the property of the other when it was acquired during the marriage, whether or not the wife was earning and bringing money into the home.

"I would like to mention the importance of the work of the Governors' Commissions to women in other countries. We work very closely with many international agencies. Mrs. Peterson, as you know, has just returned from a meeting of the International Labor Organization in Geneva. We also work with the United Nations Commission on the Status of Women, and I had the good fortune in December to attend a seminar on the Status of Women in Family Law held in Bogota, Colombia, for all women of the Western Hemisphere.

"Twenty-five countries and territories were represented. All the South American countries except Chile and Venezuela were represented, together with many of the islands in the Caribbean, and of course the United States and Canada. The seminar was an occasion for free discussion where no one recorded the conversation, so the participants really brought their problems into the open and talked about life at home.

"At the Bogota seminar we found that although some countries had improved some aspects of the legal rights of married women, the progress was uneven and there were still many inequities. Brazil, for example, only 2 years before, gave the wife the right to work outside the home without her husband's consent; but if the wife works, her husband can collect her earnings.

"Some countries do not permit the wife to open a bank account without her husband's consent, nor go to court; and many do not permit her to leave the country nor to take her children out of the country--even when she is separated from her husband--unless he gives his written consent.

"At one session a representative said: 'In my country women have no rights; they have only responsibilities.' This was true of many of the countries represented.

"I point this out because the work done by your commission, and by commissions in other States, comes to the attention of international agencies in which the United States participates and influences the elimination of inequities and the improved utilization of women's capabilities in other countries.

"The work you do not only helps women in this country; it is important, also, in relation to the example we set for the women of all nations."

Immediately following Mrs. Morrison's remarks, conference participants met in three workshops.

Workshop 1

EDUCATION AND HOME-COMMUNITY COMMITTEES

Chairman: Mrs. Evelyn M. Anderson
Reporter: Mrs. William Brentzel

Panelists:
Mr. John Conrad, Member, North Dakota Board of Higher Education - "Women in Higher Education"
Mrs. H. A. Belcher, Past Vice President, National Congress of Parents and Teachers (PTA) - "Women in Support of Education"
Mrs. Winifred Stockman, Director, Cass County Welfare - "Child Care and Working Women"
Mrs. Lois Trapp, Past District President, Federated Women's Clubs - "Volunteer Work by Women"
Mrs. Winifred Echelberger, Acting Chairman, South Dakota Commission on the Status of Women - "South Dakota Commission on the Status of Women"

Consultants:
Mrs. George E. Hariman, President, North Dakota United Church Women
Dr. A. O. DeLong, President, Dickinson State College
Mrs. Margaret C. Phelan, Member, Governor's Commission on the Status of Women
Mr. Orville Crays, Regional Representative, Children's Bureau, U.S. Department of Health, Education, and Welfare

Workshop 2

PUBLIC AND PRIVATE EMPLOYMENT COMMITTEES

Chairman: Mr. Charles Askew
Reporter: Mrs. Sybil B. Kelly

Panelists:
Mrs. J. F. X. Conmy, Past President, North Dakota Bar Association Auxiliary - "Barriers to Women's Employment"
Mr. Carl F. Fryhling, Director, North Dakota State Employment Service - "Women in Employment--Supply and Demand"
Mrs. Ann Powers, North Dakota State Representative - "Equal Pay Laws--State and National"
Mr. Ed Garvin, Personnel Director, North Dakota Tax Department - "Women in North Dakota Government"

Consultants:
Mrs. Gilman Peterson, President, North Dakota Press Women
Miss Betty Svihovec, County Auditor
Miss Marguerite I. Gilmore, Regional Director, Women's Bureau, U.S. Department of Labor
Mrs. Harriette Wolf, Superintendent, Division of Women's and Children's Employment, Illinois Department of Labor

Workshop 3

CIVIL AND POLITICAL RIGHTS, SOCIAL INSURANCE, AND LABOR LEGISLATION COMMITTEES

Chairman: Miss Marcella O. Hanson
Reporter: Mr. Wallace J. Dockter

Panelists:
Miss Dagny Olson, District Court Reporter - "Legal Rights of Women in North Dakota"
Mr. Martin N. Gronvold, Director, North Dakota Unemployment Compensation Division - "Unemployment Laws and Women"
Mrs. Ethel Avery, Assistant to President, North Dakota Farmers Union - "Wage-Hour Laws Affecting Women"
Dr. Wilson M. Laird, State Geologist - "Possibilities for Women in Government"

Consultants:
Miss Brynhild Haugland, North Dakota State Representative
Honorable William Reichert, North Dakota State Senator
Mrs. Alice A. Morrison, Chief, Division of Legislation and Standards, Women's Bureau, U.S. Department of Labor

Luncheon Session, Saturday, July 18, 1964

Mrs. Frank Jestrab presided at the luncheon session and called on the Reverend William Lindsay of the First Presbyterian Church to deliver the invocation.

Mrs. Winifred Echelberger, Acting Chairman of the South Dakota Commission on the Status of Women, brought personal greetings from Governor Archie Gubbrud and good wishes from the South Dakota Commission on the Status of Women.

Mrs. Harriette Wolf, Executive Director of the Illinois Commission on the Status of Women, relayed greetings from Governor Otto Kerner and the members of the Illinois Commission.

The following summaries of workshop panels were presented by the workshop reporters.

Report of Workshops

Mrs. William Brentzel, reporter for Workshop 1 - Education and Home-Community Committees

Education

Women can demonstrate their interest in education in many ways. As homemakers they can encourage their children's interest in learning. Outside the home women may become interested in the policies, legislative problems, and administration of the schools at all levels--local, State, and National. Women should read, listen, study, participate, and speak out in support of developments that are good.

Institutions of higher education in North Dakota face an unprecedented challenge. By the fall of 1966 nearly 4,000 more college and university students will be enrolled than were enrolled in 1963. Not only is the college-age population increasing, but the percentage of this group that goes to college is rising also. Women are well represented in the ranks of elementary and high school teachers, but are needed in increasing numbers as teachers in colleges and universities. Teaching at the college level is highly adaptable to women's needs, since teaching on a part-time schedule can be arranged without lowering standards.

Community Aids for Mothers

Some 30 percent of all the women in North Dakota are gainfully employed outside their homes. Services are needed to help them provide care for their children while they work. The most needed service is day care for preschool children. This may be provided by licensing private homes that meet standards for warm, sympathetic care. The North Dakota Committee on Day Care has a plan, a schedule, and a manual and is ready to go into action. Plans call for a sliding scale of fees, with the maximum set at $2 a day.

Homemaker service that provides temporary help in the home when a mother is ill or absent for a prolonged period of time is the second most urgent need. Although plans

for this service have not yet been formalized, they will call for the assistance of warm, motherly women who can serve on a part-time basis.

Public and private recreational facilities offer constructive supervised activities for school-age children of working mothers. The hot lunch program offered in schools is also of particular value to them.

There is great need for additional vacation activities for school-age children, such as summer camps operated by the Camp Fire Girls, the YMCA, YWCA, and volunteer groups of citizens in larger cities.

Of prime importance is the need to cultivate an appreciation of the worth and dignity of working women, so that young girls--8 out of 10 of whom will work for pay at some time of their lives--can grow up in a favorable atmosphere. In this moment of time, working mothers often suffer pangs of guilt, whether they work because of necessity or because of interest in a job or profession.

Volunteer Workers

No one has made a serious effort to compute the value of free services American women give to their communities. Women who participate in churchwork raise funds for welfare needs, as well as for the improvement of the physical plant of the church. Women active in political organizations make surveys, conduct campaigns, and educate citizens in the importance of voting.

In the area of education, women serve on school boards at all levels--community, State, and National. Their educational efforts extend beyond formal school situations and include the educational programs of the organizations they join.

Women are prominent in health and welfare volunteer work. Two-thirds of the solicitors for health program funds are women.

Community improvement and economic development often are spurred by special projects initiated by women volunteers.

Volunteer work provides an outlet for the feminine impulse to serve. It enables a woman to utilize her education and talents, but frustrations and disappointments often accompany the satisfactions.

Women's services are not always recognized. Especially in church, political, and educational fields, volunteers lack a voice in policymaking that is commensurate with their contribution. The business and educational worlds rarely recognize the valuable training and experience volunteer services provide, regardless of how professional a job may have been done.

Women need to take themselves more seriously before others can be expected to do so. There is a definite need to coordinate and limit the efforts of organizations and to finance "volunteer" work more realistically. It is one thing to give time and another to pay for the privilege of giving.

Work With the Disadvantaged

In working with disadvantaged children, it is most important to communicate with the parents as well as the youngsters. Parents must understand the value of education so they can encourage their children to learn and to have respect for education. Counseling for both parents and children is a key to success in such projects. If all the individuals concerned are not treated with dignity and respect, they will lose interest and withdraw.

Mrs. Sybil B. Kelly, Reporter for Workshop 2 - Public and Private Employment Committees

The underutilization of the talents and competence of women workers is, in part, a result of the poor motivation of women themselves. Traditional training and guidance, as well as outmoded prejudices, restrict women's employment and advancement.

Employment

Both the supply and the demand for women workers are increasing. However, although the demand for technical and professional workers exceeds the supply, the supply of applicants with limited skills or training exceeds the demand for them in acceptable types of work.

The current manpower training program is extremely important. In Devil's Lake, for example, three programs are in operation and have included women trainees. Some women who were trained as hospital cooks already have good jobs.

There is serious need for an equal pay law in North Dakota. Such a law was considered and passed by the House of the North Dakota Legislature at its last session, but the Senate did not approve it. Considerable attention should be paid to this question in the future.

The government hires more women than any other single employer in North Dakota. Some 16,400 women are employed by Federal, State, and local government agencies that offer women jobs in a wide variety of occupations and professions. Most women, however, are employed in the clerical fields. Government agencies have a good record as employers. Women with experience are welcome to return to employment when their children no longer need close supervision.

Discussion

During the discussion period, the group touched on the uneven treatment of teachers, the need for more vocational education to discourage dropouts, and the enforcement of the Federal Equal Pay Act.

Mr. Wallace J. Dockter, reporter for Workshop 3 - Civil and Political Rights, Social Insurance, and Labor Legislation Committees

Legal Rights

With few exceptions, men and women generally are considered to have the same legal rights in North Dakota.

Although women may be excused from jury duty on personal request based purely on their sex, men must have a pressing reason in order to be excused. This inequity fails to recognize that both sexes have equal obligations as citizens.

There is need also to reconsider the woman's rights to her husband's estate. A study of inheritance laws should be made regarding the amount received by the widow, looking toward the possibility of allowing her to object to her deceased husband's will and elect to take the share she would receive if her husband had died intestate.

Unemployment Compensation

Employment in North Dakota is highly seasonal. The unemployment rate is extremely high in winter and extremely low during the rest of the year. Unemployment insurance provides a cushion that protects the economy of the entire State. It provides the families of the unemployed with some purchasing power which, in turn, helps keep other workers in the State employed.

In order to qualify for unemployment insurance, an unemployed worker must have been employed for a specified period of time and must have earned a minimum of $600 a year. The wage structure is so low in North Dakota that a woman who has been employed fairly regularly may not make even $600 a year. Consequently, in addition to her low

wage, she may be denied unemployment insurance because of it. This problem needs serious consideration in the business community.

Another problem that merits consideration is the automatic disqualification of pregnant women workers for unemployment compensation. The question is how long they can work--through 4 months of pregnancy or 8 months of pregnancy, or more or less. The disqualification may be doubly unjust in that it withholds income at a time when a family may be in urgent need of it. The legislature should study the question of maternity leave in relation to unemployment benefits.

Labor Laws

Fewer than one-third of the women over 14 years of age in North Dakota are gainfully employed and provide 27 percent of the work force. It is most unfortunate that many of these women are not covered by either Federal or State wage and hour laws. The wage board often holds lengthy public hearings, but fails to bring wage standards up high enough. Often an employee can't afford to take time off to appear at a hearing called to hear all points of view, and consequently her story is never heard.

The right-to-work law hampers the organization of women into labor unions. In other States, women's wages have risen after women organized, but the right-to-work law in this State has made it very difficult for women to do anything collectively.

Discussion

About 29 people leave North Dakota every day. Many of the people who leave are college graduates, capable young people, or married couples who seek greener pastures.

Women's chances for employment in both State and local government agencies are quite good. There doesn't seem to be too much discrimination in hiring, although women probably don't always get the promotions they deserve.

If the current necessity for upgrading technical skills continues for the next few generations, it is estimated that someone entering the labor force now will have to be retrained four times during his working life. Already some thought has been given to extending the public school system through junior college and making 14 years of schooling compulsory.

Conference Summation

Mrs. Esther Peterson had been asked to close the conference by summarizing the ideas presented. She thanked the participants for a rewarding experience and explained how helpful it is to someone who "sits in Washington trying to do the right thing" to hear the people directly involved in a problem discuss it and exchange views. She congratulated the Chairman of the Commission and the Commission itself for organizing the meeting, and said that she took pleasure in the spirit of hospitality and exchange that characterized all the conference activities.

Mrs. Peterson excused herself from summarizing and said that she would rather discuss a few ideas that occurred to her during the conference.

"I was very pleased with the wide scope of your interests. You are not just talking about women as employees, you are talking about all women in all the circumstances they meet. The President's Commission looked at women in the same manner. Although we are dealing particularly with the problems of women, we cannot look at women as though they live in a world of their own. We can look at women only as members of society as a whole.

"I was pleased that so many references were made to the total economy of the community--unemployment, wages, and purchasing power. All of these are related, and we cannot take care of women without taking care of society.

"Although we who participate in conferences like this one can see the relationship between women's status and the community as a whole, there is a great deal to do to educate the public to these concepts. You must draw many citizens into your work and help them learn and develop new attitudes.

"I was glad to hear that all of you seem to understand that there are no easy answers. So many problems that women have stem from tradition, and tradition is not easy to change. We will not be able to solve all the problems at once. We will have to take only one step at a time and we must not be impatient. But, on the other hand, we must not be too patient. We do have to have thrust and movement.

"Another facet of this conference that pleased me was your attempt to learn from others' experience. It is splendid that you invited Mrs. Wolf and Mrs. Echelberger to come. I was so glad Mrs. Morrison could be here. She is a technician who has her finger on legislation pertaining to women not only in the United States but in the whole world. I like the system of bringing in consultants because we can gain from the experience of many people.

"Of course I was very pleased that education received such strong emphasis. I believe deeply that education must start early and continue throughout life. Those of us who have had a high school education and a college education have a double responsibility to those who have been left out. This is a fact we should consider when we think of the disadvantaged groups in our society.

"I was impressed also with the report on volunteer activities. I really have my interest in volunteer work to thank for my present job. After I graduated from college, I taught physical education and did volunteer work at the YWCA. That's where I got acquainted with and interested in working women. We must think of volunteer workers as women who explore to find new ways to do things that the old routines don't take care of. I could name hundreds of projects that are now part of our way of life that were started by volunteers who looked for new ways to handle problems. Volunteers with imagination, with ability to organize, can move into new circles of usefulness and plow new territory.

"I can see all the things we are talking about come to pass in the future. And in the process, ideas are going to change. We are going to realize and acknowledge that sensitivity, aggressiveness--all skills--belong to both sexes. We are going to acknowledge

that traits such as emotionalism, reliability, compassion belong to both sexes, too. The myths that have dominated thinking about the capabilities and limitations of men and women are being dispelled as we move ahead. They will eventually disappear.

"Some of the things I enjoy most on my job are the letters I receive. On the whole, it is delightful to read the honest opinions of people who sit down to write to their Government about things that affect them. I want to tell you about one letter I received recently which began 'Dear Mrs. Peterson: It is all your fault.' I wondered what I had done this time. The letter went on: 'My 13-pound weight loss, the fact I feel better than I have in many years, the fact my interest in life and its activities is keener than ever before, Mrs. Peterson, it's all your fault.'

"The writer described how she and her naval officer husband and two teenagers moved around the country. She said she saw the report of the President's Commission and agreed with it. 'We moved into a new house, settled, and got the children in school. One morning I woke up to the fact that it was around 10 o'clock and the laundry was done, the polishing was done, and I had written to everyone I owed a letter. I was bored stiff and feeling a little bit sorry for myself.' Then she remembered the report and the idea of doing something away from home occurred to her.

"She volunteered first, and loved it. The volunteer job led her to a paying job. Someone asked her to take on some work for several hours a day. 'When my friends heard of my new venture their reactions were mixed. With womankind, the universal feeling seemed to be how lucky I was, getting dressed up every day and being able to eat in town.'

" 'Well, it has been fun and more rewarding than I ever suspected. In 2 months I lost 13 pounds that I had wanted to lose and couldn't sitting at home. The walk to the bus is getting the job done fast.'

"Then she said: 'It is sinful to stagnate if you can be of use. I do think happiness comes in usefulness, feeling we are needed and we are useful. My prayerbook contains a prayer, the essence of which is that when we die we must give an account of time lost and talents unused. And now I weep for all the minutes I have lost and for the people who have let their talents lie fallow, either through laziness or through unawareness of any talent, and have lost the joy of being useful.'

"I think that sums up what we really want. We want a good life for everybody and we want all of us to have the opportunity to fulfill our desires to be useful at the highest levels of our capacities. You have taken a great step toward realizing this goal for the women of North Dakota, and I congratulate you and wish you further success in your quest."

The luncheon session adjourned. Participants were invited to tea at the Governor's Mansion at 3 o'clock in the afternoon.

UTAH

The development of a training program for Utah volunteer fire departments which would most economically and effectively utilize the best fire training methods and procedures presently available was the basic purpose of this study. The specific objectives were to ascertain the scope of volunteer fire department training programs as they presently exist in Utah and other states, to indicate those areas which need improvement in Utah, and to suggest solutions to problems uncovered in the study. Information was sought through a survey of states, personal interviews and observations, the use of an advisory panel, questionnaires to individual fire chiefs, library materials and the use of a rating committee. Recommendations include: (1) the construction of a permanent state fire college, (2) the enlargement of the state instructional staff, (3) the development of a concentrated, state-coordinated program of public relations and a complete set of forms and procedures, (4) subjection of the volunteer fire departments to the supervision of the local governing bodies, and (5) additional research in the possible implementation of a 2-year associate degree program with appropriate teaching aides, training followup, and objective rating systems to grade fire departments. ACKNOWLEDGEMENTS

Grateful acknowledgement is extended to the following individuals, groups and organizations, whose efforts have made these pages possible:

Wilson W. Sorensen, President, Utah Technical College at Provo;
Robert Tanner, State Fire Marshal;
Allen R. "Captain" George, State Fire Training Instructor;
Abram Bywater, General Manager, Utah Fire Rating Bureau;
Roger B. Honeyman, Chairman, Evening School, UTC at Provo;
Fire Chiefs who completed and returned the questionnaire;
Officials in the thirty-three states responding to my letter of inquiry, who provided me with valuable information concerning fireman training programs in their respective states.

It is very much in order to give a special thanks to Mr. John F. Stephens, Director, Utah Research Coordinating Unit, whose keen insight and perspective gave constant direction to this study and increased whatever relevance it may have.

This study was conducted under the auspices of the Utah Research Coordinating Unit, which placed its facilities and aid at my disposal.

SUMMARY

The modern volunteer fire department has a complex and difficult mission. It must be fully prepared to function effectively in each of the areas of fire protection with which a fire department must be concerned. It must be capable of combating industrial fires as well as grass fires - fires in multi-story buildings as well as fires in barns and outbuildings. To obtain this desired level of preparation, a complete and well-rounded training program must be readily available to each department in the State. The training programs presently available to the volunteer fire departments in Utah, and the facilities for conducting this training, are not meeting this need.

The basic purpose of this study is to provide a basis for the development of a training program for the volunteer fire departments in the State which will most economically and effectively utilize the best fire training methods and procedures presently available.

The specific objectives of the study are fourfold: 1. to ascertain the scope of the fire training programs for volunteer departments presently existing in other states; 2. to ascertain the scope of the training program for volunteer fire departments as it presently exists in Utah; 3. to indicate those areas in which improvement of the Utah training program is required; and, 4. to offer suggestions for the solution of the various problems uncovered in the study, and new approaches to those problems, whenever the need appears.

The methods used to obtain the information used in this report were: A survey of states, personal interviews, personal observation, the use of an advisory panel, questionnaires to individual fire chiefs, library materials and the use of a rating committee.

The study concludes that the Utah training program suffers from: A decided lack of physical facilities (such as training towers, fire test buildings,etc.; an insufficient number of state instructors to carry the training program to the various departments; an inadequate system of public relations; a rudimentary system of forms and procedures which fails to fully inform the local departments as to the services and facilities available to them; an inadequate exchange of information between the local and state levels of fire service; an outdated training manual; an inefficient form of departmental organization; a partial lack of desire on the part of the local departments to participate in a complete training program (although it must be noted that working conditions, job requirements, and inadequate time contribute to this lack of desire).

Some of the recommendations made include: The construction of a permanent state fire college; the enlargement of the state instructional staff; the development of a concentrated, state-coordinated program of public relations and a complete set of forms and procedures; and subjection of the volunteer fire departments to the supervision of the local governing bodies. The need for additional research in the area is indicated.

CHAPTER I

INTRODUCTION

It seems to be a tragic principle of fire safety that nothing is ever done to improve existing conditions until disaster strikes. Chief J. I. Fetters gave some examples of this tendency in an address to the Illinois Firemen's Association at Decatur, Illinois on October 23, 1962 (numbering mine):

> "1. The Coconut Grove Fire in Boston, 1942 - 493 dead. This fire resulted in laws to prevent over-crowding of places of assembly and required signs showing the safe number of occupants, laws requiring adjacent swinging doors to revolving door exits and laws requiring emergency exits;
>
> 2. The Collingwood School Fire, 1908 - 174 dead, and the Iroquois Theatre fire in Chicago, 1903 -602 dead. These fires preceded laws requiring panic bars on doors of theatres and schools;
>
> 3. Ringling Brothers Circus Fire, Hartford, Connecticut, 1944 - 163 dead. Laws requiring circus protection by hose-lines laid to the circus lot, weeds cleaned off the lots and axes ready to cut tent ropes;
>
> 4. Cleveland Clinic Fire, 1929 - 124 dead. Laws requiring the use of safety film for X-rays and photo films, and most 16 mm films;
>
> 5. Baltimore Fire, 1904. Standards for hose threads and hose fittings;
>
> 6. Chicago Fire, 1871. Laws setting up zoning systems with wide streets for fire breaks;
>
> 7. San Francisco Earthquake, 1906. Laws providing emergency water supplies."

This same pattern has been apparent here in our own state. Many examples could be cited of communities doing nothing about local fire safety until some disaster impelled action. This should not be the case. Utah communities must be aware of the fire safety problems existing in their respective areas before a disaster compels such awareness, and must plan for all eventualities. Perhaps most important, they must be more willing to spend some money to improve the level of fire protection which they are presently receiving. A community's financial support of its fire department is most important,

but spending money without knowing what to buy is foolish. Too many communities will buy a piece of equipment and rest comfortably in the belief that they have adequate fire protection, not realizing that equipment alone does not make an effective fire department. A community must make sure that its firemen know how to use their equipment in all situations conceivably occuring within the area of protection with which they are concerned. A community thus assured of adequate fire protection may enjoy two important benefits of such farsightedness: (1) peace of mind and (2) possibly lower fire insurance rates. To achieve these desirable results, each community must assume its fair share of responsibility.

Harry A. Ohlrich, Coordinator of Fire Service Training for Southwestern Ohio, in an article in the May 1966 newsletter, "Around the Buckeye Training Table," had this to say:

> "It is absurd to expect fire departments - volunteers in particular - which in some cases were organized and equipped to cope with only the simplest, commonplace types of fires such as have previously been encountered in rural and suburban areas, to successfully combat today's complex, even deadly, types of blazes that evolve in these new hazards. Indeed, it is remarkable that volunteers have managed to achieve the high plane of efficiency which distinguishes so many of them in the light of the failure of some local and area governments to support them financially and morally.
>
> It is high time that volunteer fire forces be reviewed and reevaluated in view of their present and future responsibilities. It is time that they are given financial as well as moral encouragement. It should no longer be necessary for them to finance their own essential operations -- to pay for the privilege of risking their necks. The communities, businesses and industries which they must protect should pay their just share of that protection."

The conclusions reached by Mr. Ohlich are timely and accurate, and deserve our serious consideration. But they do not go far enough. The volunteer fire department exists because of the need of smaller communities for fire protection and the impracticality of their maintaining full-time fire departments. The fires with which most volunteer departments have historically dealt have been in barns, farm houses, haystacks and fields. Now, however, these same departments are being called upon to fight and control fires in oil storage areas, grain elevators and large multi-story buildings. There are new construction and industrial materials with burning characteristics and properties totally unlike anything known to the traditional volunteer departments. Today's volunteer fireman must know how to fight many different classes and types of fires. He must have training far in excess of that provided

for his forerunners. He must be, in every sense of the term (except perhaps the receipt of full-time compensation) a professional fire-fighter.

A. PROBLEM STATEMENT

The modern volunteer fire department has a complex and difficult mission. It must be fully prepared to function effectively in each of the areas of fire protection with which a fire department must be concerned. It must be capable of combating industrial fires as well as grass fires - fires in multi-story buildings as well as fires in barns and outbuildings. To obtain this desired level of preparation, a complete and well-rounded training program must be readily available to each department in the State. The training programs presently available to the volunteer fire departments in Utah, and the facilities for conducting this training, are not meeting this need.

B. OBJECTIVES OF THE STUDY

The basic purpose of this study is to provide a basis for the development of a training program for the volunteer fire departments in the State which will most economically and effectively utilize the best fire training methods and procedures presently available.

The specific objectives of the study are fourfold:

1. To ascertain the scope of the fire training programs for volunteer departments presently existing in other states;

2. To ascertain the scope of the training program for volunteer fire departments as it presently exists in Utah;

3. To indicate those areas in which improvement of the Utah training program is required; and,

4. To offer suggestions for the solution of the various problems uncovered in the study, and new approaches to those problems, whenever the need therefor appears.

C. LIMITING FACTORS

The findings resulting from this study were limited in several ways. These limitations include the following factors:

1. The majority of the questionnaires sent to the chiefs of the various volunteer fire departments were not returned, despite an extensive follow-up procedure;

2. The questionnaire was not as well-constructed as had been desired, despite the assistance of the advisory panel (this is discussed fully at Section B of Chapter II - Procedure);

3. The rating of the various departments as to personnel effectiveness in fire fighting procedures and tactics was left wholly to a three-man committee, without the participation of the writer. Thus, the exact procedures utilized by the committee and the criteria used in rating the various departments are not available in this study. A list of the departments and the ratings which they received is likewise unavailable. The rating committee was utilized because of the inability of the advisory panel to agree upon an effective rating system and the unwillingness of the various fire officials to be responsible for any list of cities and towns graded as to department effectiveness. The rating list published by the Utah Fire Rating Bureau was deemed inappropriate for our use because many of the factors underlying its rating schedule are extraneous to those matters which are the subjects of this study. (i.e. building fire safety construction, water supply, etc.);

4. The response from other states was not structured or uniform in scope or content, though much valuable information was obtained from this source;

5. There have been no substantive surveys made of fireman training programs as they exist in the United States, thereby providing no basis for the comparison or evaluation of replies received from other states;

6. There is in existence (to the knowledge of this writer) no recommended uniform training program for volunteer fire departments, which can be used as a standard in the evaluation of the program existing at the present time in Utah. Thus, any evaluation made of the training program in any state must of necessity be more subjective than perhaps is desirable.

D. DELIMITATIONS

In addition to the limiting factors listed above, there were certain delimitations placed on the project which the investigator felt were necessary to give more definition to the study.

1. The area of study was limited to the volunteer fire departments, and to those methods, procedures and approaches which would improve the quality and quantity of the training which they receive (although the acquisition of some information concerning full-time departments was not altogether avoided);

2. The consideration of the general functional needs of volunteer firemen training programs constituted the main emphasis of the study. Thus, a minimal amount of research was conducted as to the actualities of classroom instruction, teacher aptitudes and teaching skills required by the fire instructor, or the quality of the instruction presently available.

3. The study was restricted to State and local fire safety officials and leaders. No attempt was made to solicit information from the individual volunteer firemen.

E. DEFINITIONS

1. ITINERANT INSTRUCTION - fire training instruction provided by the State at each local fire department by instructors traveling to the town or city from some central or regional source.

2. ITINERANT INSTRUCTORS - "traveling" instructors; instructors providing individual fire departments with itinerant fire instruction.

3. PROTECTIVE AREA - that area constituting the immediate fire safety responsibility of a particular department.

4. REGIONAL FIRE CONFERENCE - a training session conducted by State fire instructors in a given geographic area and open to members of all fire departments in that area.

5. STATE FIRE COLLEGE - a permanent facility built for fire training purposes and available for the use of every fire department in the State. Such facility would be staffed by state fire instructors who would serve as itinerant and regional instructors whenever the fire college was not in use.

6. STATE INSTRUCTIONAL STAFF - in Utah, the full and part-time fire training instructors who work out of the Utah Technical College, Provo. These instructors teach at the state, regional and itinerant levels, and spend most of their time with the volunteer fire departments of the state.

7. VOLUNTEER FIRE DEPARTMENT - a fire department consisting of citizens performing the service of fire protection of their own free will, receiving minimal or no compensation for their efforts; not a full-time department; a fire department consisting of part-time firemen who are paid only for those services actually performed, on an hourly basis, and who depend upon work other than firefighting as their principal means of support; for the purposes of this study, those departments consisting of one or more full-time firemen in addition to volunteer firemen are considered volunteer fire departments.

CHAPTER II

DESCRIPTION OF THE RESEARCH DESIGN

A. DESIGN FORMAT

In order to accomplish the purpose of this study, it was necessary to seek information from the following sources:

1. SURVEY OF STATES - to ascertain the "state of the art" throughout the United States.

2. PERSONAL INTERVIEWS - to ascertain the state of the present training program in Utah, to pinpoint problem areas and to obtain suggestions and recommendations for improvement.

3. PERSONAL OBSERVATION - to obtain first-hand knowledge as to the present operation of the State fire training program.

4. USE OF AN ADVISORY PANEL - to obtain the expert opinions of leaders in their respective fields as to the relevance and applicability of various approaches and methods in firemen training, and to obtain recommendations for improvement in the area.

5. QUESTIONNAIRES SENT TO INDIVIDUAL FIRE CHIEFS - to obtain information as to the training needs of the local fire departments throughout the State, to solicit the personal evaluations and opinions of the fire chiefs, and to determine the attitude existing among the departments as to the new programs which have been suggested.

6. LIBRARY MATERIALS - to gain depth of understanding in the field and to obtain valuable background information.

7. USE OF A RATING COMMITTEE - to obtain some form of information as to the present levels of preparedness and training of the various volunteer fire departments.

B. POPULATION AND SAMPLE

The population for this study consisted of all of the volunteer fire departments in the State of Utah.

The sample chosen for receipt of the questionnaire consisted of all of the fire chiefs of the volunteer fire departments in Utah. The list of fire chiefs and their addresses was obtained from the State Fire Marshal and was compiled from the most recent information available to that office.

The inquiries sent to other states were directed only to those states submitting information to the FIREMEN magazine, for use in the annual survey conducted by that publication. The December 1965 issue was used for this purpose. Such selectivity was utilized because of ease of operation and because it was felt that states not even responding to the inquiries of a trade publication would not have very much to report to us or much inclination to do so.

C. PROCEDURES

1. SURVEY OF STATES - to ascertain the "state of the art" throughout the United States. It was felt that, in order to give the fullest opportunity for the various states to respond in a complete and comprehensive manner, and to provide for flexibility in their approach to the problem, the letter of inquiry must of necessity be framed in broad and general terms. Such feeling was justified by the responses received, as the wealth of information submitted and the many salient comments as to the effectiveness of the various programs employed were instructive and most helpful. It is felt that such information and comment would not have been so freely provided had a more restrictive and objective inquiry been utilized.

It was recognized, in analyzing the returns from the various states, that an overstatement of accomplishments and an understatement of problems and failures would be a natural tendency in those responding. It was also felt that this tendency would be more pronounced in those having responsibility for the success of the program in their state. It is difficult to compensate for this tendency as there are few alternate sources of information with which to compare the submitted information and ascertain the degree of objectivity involved. It is believed, however, that the responses as a whole were quite objective and analytical, and that any compensating factor would be quite small.

The problem of analyzing the material thus collected was difficult, due to the random nature of the replies received and the relatively unstructured inquiry. Also, the differences in geography, economics and population among the states would tend to make meaningful comparison impossible. Nevertheless, the replies indicated, in many areas, a similarity in approaches and solutions to problems, and therefore, a general agreement within those areas. Where approaches differed substantially, it was felt that those of states having characteristics roughly similar to Utah's would be most applicable here.

2. PERSONAL INTERVIEWS - to ascertain the state of the present training program in Utah, to pinpoint problem areas and to obtain suggestions and recommendations for improvement. These interviews were conducted solely at the state level, with no attempt being made to interview the local fire chiefs or members of the local departments.

It was felt that here again the tendency would be towards overstatement and a glossing-over of defects. The information received from other states and the returns from the questionnaires provided convenient points of reference for evaluating the interview results. On the basis of the comparisons thus made, it appears that most of those interviewed were objective and forthright in their evaluations.

These personal interviews proved to be an important part of the study, as they provided much valuable background information and a better understanding of the various problem areas.

3. PERSONAL OBSERVATIONS - to obtain first-hand knowledge as to the present operation of the state fire training program. This phase of the study provided the writer with more background information and contributed to a better in-depth understanding of the problems of fire training. It consisted of visits to various departments, discussions with several training officers and participation in an actual training situation.

4. ADVISORY PANEL - to obtain the expert opinions of leaders in their respective fields as to the relevance and applicability of various approaches and methods in fireman training, and to obtain recommendations for improvement in the area. In meetings and subsequent correspondence, the members of the panel contributed a great deal to the relevance of this study. The panel redrafted the fire chief questionnaire and approved its final form, considered the relationship of the fire department to the community it serves, and worked on a rating system to measure the collective ability of the departments to function as fire fighting units.

The advisory panel is a powerful and useful tool when used properly, but a source of confusion when misused. For the purposes of this study, the panel was presented with rough drafts and concrete proposals, and asked to recommend changes and improvements therein. The panel members were <u>not</u> presented with amorphous ideas and research needs, and asked to develop a meaningful program. They thus reworked an <u>existing</u> questionnaire, discussed <u>specific</u> policy questions and dissected a <u>proposed</u> rating system. The expertise brought to bear by this panel upon the problems presented to it was extremely valuable to this study. The panel must be given credit for any value the study may possess.

The members of the panel were: Robert Tanner, State Fire Marshal; Allen R. George, State Fire Training Instructor; Al Donaldson, Chief in Charge of Training, Salt Lake City Fire Department; Jim Wilkins, Grading Engineer, Utah Fire Rating Bureau; Clyde L. Peterson, Chief, Ogden Fire Department; William Ruff, Chief, Springville Fire Department; Walter Ulrich, Jr., State Specialist, Trade and Industrial Education; Clifford Rampton, Chief, Bountiful Fire Department; Stanley M. Smoot, Davis County Commission Chairman; Richard Klason, Deputy State Forester; and, John F. Stephens, Director, Utah Research Coordinating Unit.

5. QUESTIONNAIRES - to obtain information as to the training needs of the local fire departments throughout the state, to solicit the personal evaluations and opinions of the fire chiefs, and to determine the attitude existing among the departments as to the new programs which have been suggested. The questionnaire was designed to avoid the reluctance of the departments to expose themselves to public scrutiny, and to offer an opportunity for objective evaluation of the successes and failures of each department. In spite of the care taken in this regard, the questionnaire was not as capable an instrument as had been desired. Some of the reasons for its partial failure were probably:

A. The mistrust of the volunteer fire chiefs and the desire to avoid public inquiry;

B. The natural tendency of a responding fire chief to put his department in as favorable a light as possible; and,

C. The ineffectiveness of the three-point grading scale used in several of the questions (i.e. wholly adequate, satisfactory, and wholly inadequate). Such a grading system elicited a "satisfactory" response from all but the most determined respondent. Few chiefs would be so bold as to claim to be "wholly adequate", and few would be so derogatory as to claim to be "wholly inadequate" as a department. Perhaps a five-point graduation would have been more effective, with the highest and lowest grades probably being eliminated by lack of response.

The fire chiefs were not asked to identify themselves or their departments and no numbering system to provide for such identification was used. Some two weeks after the questionnaires had been sent out, an attempt was made to reach each chief by phone, excepting only those known to have replied (because of notations in the questionnaire itself or distinguishing postmarks). This proved to be an almost impossible task, as the lists provided by the State Fire Marshal's office were either out of date or erroneous in many instances. In all, eighty-three of the calls were completed, with the writer talking either to the fire chief or to his wife. The fire chiefs were asked if they had received the questionnaire, and whether they had completed and returned it to the Board of Education Offices. The wives were asked to leave such a message of inquiry for their husbands. Several of the chiefs thus contacted revealed a marked determination not to fill out or forward the questionnaire, and indicated that they had thrown the instrument away. Others indicated that they would immediately put the questionnaire in the mail. Still others asked for another questionnaire, a request with which we readily complied. Those chiefs not contacted were excluded either because they were never home when the calls were made, or because the listed phone number was incorrect and no one contacted seemed to know who the chief was or what phone number to call. This difficulty in reaching fire chiefs indicated the need for requiring

the local departments to submit at least an annual report to the State Fire Marshal. Otherwise, much needed information will not be (as it is not now) forthcoming.

The questionnaire, with all its faults, yet was largely a success, due to the opportunity given after most of the questions for "comments" or "opinions" of the respondent and to the important questions included in the instrument at the suggestion of the advisory panel.

6. LIBRARY MATERIALS - to gain depth of understanding in the field and to obtain valuable background information. This source was not as helpful as had been expected, as the various libraries available for this study had a dearth of information on the training and functioning of a volunteer fireman. What material was available was outdated and somewhat inapplicable. Yet some information was gleaned from this source, and thanks to the substantial periodical libraries of the State Fire Marshal and the Salt Lake City Fire Department, sufficient material was obtained to give added meaning and direction to this study. It appears that the most up to date and meaningful literature on the subject is in periodical form or in report form and published by the various fire training associations in the country. The various clearinghouses for research in vocational education offered no assistance in this study, as little research has been done in the area. Those contacted were: The ERIC Clearinghouse on Vocational and Technical Education, Ohio State University; and The Center for Studies in Vocational and Technical Education, University of Wisconsin.

7. RATING COMMITTEE - to obtain some form of information as to the present levels of preparedness and training of the various volunteer fire departments. The advisory panel was unable to agree upon a suitable rating system for the volunteer fire departments, and no one at the state level seemed to want the responsibility of rating the departments in this area.

The writer asked the following individuals to form an ad hoc rating committee: Abram Bywater, General Manager, Utah Fire Rating Bureau; Robert A. Tanner, State Fire Marshal; and Allen R. George, State Fire Training Instructor. The procedure utilized by the committee, as reported to the writer, was to use, as a starting point, the rating received by each city under the "Fire Department" section of the Standard Grading Schedule (which constitutes 30 percent of the total grade received by cities for fire insurance purposes). Other sections of the Grading Schedule include "Water Supply," "Fire Alarm," "Fire Prevention," "Building Department," and "Structural Conditions." The introduction to the Grading Schedule discusses its purpose.

"The Grading Schedule is a means of classifying municipalities with reference to their fire defenses and physical conditions. From a study of pertinent conditions and performance records extending over many years, certain standards have been developed; these are set forth in the Schedule, and the various features of fire defense in the municipality under consideration are compared with them. For each deviation from these standards, deficiency points are assigned, the number depending upon the importance of the item and the degree of deviation. The natural and structural features that increase the general hazard, and the lack or inadequacy of laws or of their enforcement for the control of unsatisfactory conditions, are graded in the same way. The total number of deficiency points charged against the municipality determines its relative classification. The word "municipality" is used in this Schedule in a broad sense to include cities, towns, villages, or other municipal organizations."

There are thirty-four items considered under the "Fire Department" section, only one of which is training. Many of the other items are, however, strongly related to the training received by the department. The items are:

FIRE DEPARTMENT

Item

1. Number of Officers
2. Number and Qualification of Operators
3. Qualifications of Officers
4. Chief's Tenure of Office
5. Appointment and Promotion of Officers
6. Enlistment Requirements
7. Retirement Requirements
8. Number of Engine and Hose Companies and Apparatus
9. Number of Ladder Companies and Apparatus
10. Distribution of Companies
11. Total Manual Strength of Companies
12. Manual Strength of Companies in or near the High-Value District Considered
13. Pumper Capacity
14. Reserve Pumpers
15. Condition of Apparatus
16. Fireboats
17. Powerful and Special Stream Appliances
18. Small Stream Appliances
19. Reserve Hose-Carrying Vehicles
20. Amount of Hose

21. Condition of Hose
22. Emergency Equipment
23. Minor Equipment
24. Radio Communication
25. Repair Facilities
26. Salvage Appliances
27. Fire Stations and Fuel
28. Regulations and Discipline
29. Training
30. Response to Alarms
31. Fire Methods
32. Conditions Affecting Fire Department Operations
33. Building Inspections
34. Records.

The committee realized that many of the ratings were out of date, since the cities are generally graded only every eight to ten years. Also, since cities are generally regraded at their own request and the rating process thus usually occurs at the most opportune moment for the city, the ratings can be assumed to be higher than they normally should be. To remedy this tendency to neglect recent changes and to reflect relatively "ancient" states of preparedness, the members of the committee studied each of the cities and regraded them according to their collective knowledge of the present conditions therein. They also attempted to eliminate factors having little or nothing to do with training or department effectiveness. This was admittedly a highly subjective method, but all rating systems have some degree of subjectivity inherent within them, and this was the best and most objective available to us for use in this study.

CHAPTER III

REVIEW OF LITERATURE / STATUS OF PROGRAMS

A. NEED FOR FIREMAN TRAINING

"The time has come to study our increasing fire problem on a nationwide basis. There can be no doubt that something should and must be done about it.

The recent terrible fire with such tragic loss of life in Montgomery of my own State of Alabama reaffirms the urgency of this need. That sad occasion followed in relatively close succession to the burning of the McCormick Place in Chicago which is said to be the most devastating fire since the 1906 San Francisco fire.

In spite of our great progress as a Nation in most all lines of human endeavor, we still have unwarranted and excessive losses of lives and property by fire. As the President pointed out in his message to Congress on February 16, 1967, our loss in lives, which in the year 1965 was 12,000, is about four times greater on a per capita basis than that of the United Kingdom, and is over six times as great as that of Japan. Needless to say, our property loss each year amounts to billions of dollars (one and three-quarters billion in 1965). Immediate steps should be taken to see just how and why the United States is so sadly lacking in this regard."

This statement, taken from the remarks of Senator Sparkman in the Congressional Record - Senate, February 27, 1967, illustrate the great need existing in our country for a complete and thorough reevaluation of our present fire safety posture.

In Utah, the property loss from fire in 1965 amounted to nearly four and one-half millions of dollars ($4,470,746.00), and the loss of life due to fire was 74 (43 of which died in the fire following the hard landing of a United Air Lines 727 jet airliner). These figures indicate this same need for reevaluation exists strongly in our own State.

It is within the scope of the present study only to consider our needs in the area of fireman training and the general preparedness of the volunteer fire departments in the State. Under this topic (need for fireman training) this study will discuss the State Fire College and the itinerant instructional program.

1. STATE FIRE COLLEGE

In the Utah State Fire Marshal's annual report for the year 1965, the following recommendation was made:

> "While much of the basic training can be carried out at the fire stations, facilities for training to handle large severe fires are totally lacking in the State. Such a facility should be located on a site where the use of fire, smoke and water need not be restricted... (These facilities) would provide the means of training firemen to handle a 'live' fire."

While the need for a permanent state fire college could have been stated more positively in the report, it has long been recognized by officials in the state. The Utah State Fireman Training Advisory Committee has been considering the purchase of a tract of land in Orem, Utah, for the erection of such facility. The State Fire Marshal, in conjunction with the Utah Technical College, Provo, has compiled a sample pamphlet (included in this report as Appendix A, describing the purpose and scope of the proposed fire college).

The factors which indicate the rather substantial need for a state fire college are these:

1. Firemen need actual fire-fighting experience in their training. Lectures, demonstrations and drills are necessary elements in a fireman's education, but cannot fully prepare him to fight fires. A football team cannot be accurately rated by its appearance on the practice field; rather it is its performance under the pressure of actual competition on the playing field which determines its championship caliber (or lack thereof). You can learn a great deal about football from books, but you can't learn to play the game without actual experience. This principle is as true in the area of firefighting as it is in the area of athletics. Only actual experience can adequately prepare for "game" conditions; only actual experience can translate academic learning to physical competence.

The National Board of Fire Underwriters, in a special interest bulletin dated August 1, 1946, (#235), had this to say on the subject:

> "Capable firemen cannot be obtained except through experience, and this experience must include actual fire fighting. There must be rooms, of concrete lined with hard burned brick, in which fires can be built and the men trained in the proper approach and technique. The ideal would be a building of several stories and a basement, where the various evolutions, including the freeing of smoke and heat, can be carried out. Only the

larger cities can afford such a structure, but the states should interest themselves in the erection of such a building where other departments can be trained in actual fire fighting.

Facilities must be provided to permit training which will show the value of different appliances, extinguishing agents and methods of operation, and how these would be modified by the type of material burning. Oil fires, fires in freeburning material, and deep-seated fires are all factors in the fire-fighting technique of a modern department."

Reference may also be made to the returned questionnaires, which indicated a large percentage of the responding fire chiefs felt a real need for training under actual fire conditions. As one chief stated: "We aren't able to know whether we can put out a certain type of fire or not, until the alarm sounds, and then it's too late if we can't."

Facilities to provide actual fire conditions are thus necessary for adequate training, and at the present time there are no such facilities in the entire state. This condition should not long be left unremedied.

2. Systematic, standardized training can best be accomplished through statewide planning and coordination, having as the basic point of reference a permanent state fire college. Standardized procedures and methods of operation enable neighboring fire departments to work cooperatively in fighting large fires. Effective mutual aid systems can be planned and implemented by local authorities working with state fire officials.

It must also be noted that there is a marked trend in the country toward higher degrees in firefighting offered by both two-year and four-year colleges. While the offering of higher degrees does not yet appear to be feasible here in Utah, the establishment of a permanent state facility, offering standardized instruction, would enable graduate fire instruction, leading to associate or bachelor degrees, to be more easily implemented (see the "Firemen" magazine for December 1967).

3. With the establishment of a State Fire School, the fire service in Utah would become professionalized, if not in fact, at least in ability and training. The fires occurring in the state burn without regard to the type of department fighting it, and all fire departments must be prepared to act when the need arises. Big city departments have a wide variety of types and classes of fires occurring constantly within their protective areas, but in the small departments, particular types of fires may occur only rarely, if they occur at all. Yet small departments must be able to function effectively when those rarities do occur.

2. ITINERANT INSTRUCTION

In order to provide the quality and consistency of training so badly needed by the fire service, the present instructional staff must be expanded. It is a study in futility to expect one man, even with the assistance of four or five part-time instructors, to be completely effective in satisfying the training needs of the fire departments in the state. Since the part-time instructors are all full-time firemen, the travel time required to reach many of the departments necessarily restricts those instructors as to their effective geographical teaching area. The full-time instructor is generally limited to conducting his classes in the evening (due to the working schedule of the volunteer firemen), and can rarely teach more than one class in a day. If he were to teach twelve monthly classes during a year's time, in as many departments as mathematically possible (excluding only Saturdays and Sundays in the calculations and not holidays, vacations or time spent on other training activities), he would be able to teach in only twenty-two departments, or only 15.9% of the departments in the state each year, and would reach all of the departments every six and one-quarter years. Even this situation, which assumes the best possible performance on the part of the instructor, does not appear to be enough. Many of the states contacted reported that reaching every department in the state every two years, with a coordinated series of courses, was a desirable goal. To achieve this situation, the percentage of departments reached each year should approach 50%. The recruitment of new firemen and the tendency of the old to forget that which they have learned and not yet used, requires more constant attention from the state instructors than is presently the case. Even with the work of the five part-time instructors, the yearly average of departments actually receiving at least one class during the year is only thirty-two (information obtained from the annual report of the State Fire Marshal for the years 1964, 1965, and 1966). The effectiveness of these part-time instructors is a point yet to be resolved; and one additional full-time instructor may well prove to be more effective, and more inexpensive, than all five part-time men. Further research needs to be done to provide an anwer to this question. Nevertheless, in order to assure professionalism and competence in the fire departments of the state, and to make possible the systemization of the state fire training service, more qualified full-time instructors are needed.

B. THE PRESENT UTAH TRAINING PROGRAM

The Fire Training Program in the State of Utah presently functions on three levels - state, regional and local as discussed below.

1. STATE LEVEL TRAINING

The state level training program previously consisted of two annual events; a Spring Instructor's School and a Fall Fire Seminar. The

Fall Seminar was abandoned in 1967 because of inadequate participation of the various fire departments (at past seminars, only 30% of the departments in the state were represented, with many of these being represented by only one man). These seminars appeared to suffer from several fatal defects:

a. The distance required for travel and the time involved for such travel by many departments, usually at their own expense, made participation impractical or difficult.

b. The difficulty which many of the volunteer firemen had in taking time off from work and attending the seminar, thereby receiving no compensation from their work and none as firemen, made attendance undesirable for them.

c. As indicated by comments on the returned questionnaires, the material covered at the seminar was either inapplicable to, or too advanced for, the training needs of the small volunteer department, or too simple for the larger metropolitan departments. In either case, attendance suffered because of this difficulty in adjusting the program to the needs of all of the departments in attendance.

In place of the state level seminar, the state instructional staff began experimenting with regional conferences.

2. REGIONAL LEVEL TRAINING

The regional level training program consists of regional conferences held in various areas of the State and conducted by the state instructional staff. The first three of these regional conferences were held in September 1967, at Price, Richfield and Fillmore, on successive weekends. They consisted of lectures, films and discussions on Friday evening and working demonstrations on techniques of fighting class "B" fires on Saturday. The regional conferences appear to be working out quite well, and substantially increase the number of firemen participating in such training programs. For example, where only one man from an entire regional area attended the state level fire seminar the previous year, over 60% of the firemen in the area attended the two-day regional conference held there this year. Such significant results should not be ignored in the development of any training program which is effected in this state.

3. LOCAL LEVEL TRAINING

The local fire training program, as it presently functions, can be divided into two general areas; the training provided within the departments themselves by department personnel, and that provided by state itinerant instructors operating out of the Utah Technical College at Provo.

a. Training within the departments - the present study included no attempt to evaluate the training provided by the individual departments in the state, since the wide disparity in quality and scope makes any meaningful comparison extremely diffcult if not impossible. It can only be said that each department has periodic meetings (monthly or weekly) at which some training is attempted. Some of these meetings reportedly are little more than "socials", while others get some real training accomplished and effectively supplement whatever training is received from the state. The rest fall somewhere in between these extremes. It was evident to the State Fire Marshal and officials at the Utah Technical College, Provo, that reliance solely upon intradepartmental training, using as instructors members of each department, is misplaced and illfounded. It was equally as evident that to acquire standardized, high quality instruction in every department in the state, reliance must be placed upon the state instructional system.

b. State itinerant instruction - accordingly, the state itinerant instructional program was instituted in February, 1964. At the present time, there is one full-time itinerant instructor, and four part-time instructors (who are full-time firemen) operating out of the Utah Technical College at Provo. These instructors travel to the various departments at the request of the local department and present weekly or monthly classes in subjects of the department's choosing. The content of this training, provided in each department, largely depends on local facilities, equipment and environment, and is roughly similar to that provided by itinerant instructors throughout the United States. This training is well-adapted to the needs and limitations of the volunteer departments and should be continued. But this alone does not appear to be enough, as the advantage of full departmental participation and personnel familiarization with the department's own equipment which is gained by such itinerant instruction, is obtained at the expense of other training essentials which cannot be provided on the local or regional levels. The returned questionnaires indicated that one of the essentials sacrificed in the present program is training under actual fire conditions. Others indicated were: A lack of adequate training facilities; a lack of sufficient training materials; and an inability to standardize and compare the training received by the various departments, due to the many variables encountered in the departments.

In a letter to the writer dated August 18, 1967, Mr. Harry H. Wolff, Director, Visual Education, Western Actuarial Bureau of Chicago, Illinois, made some significant comments concerning the need for both itinerant instruction and for a permanent state fire facility.

> "The best, in our opinion, of the several training program outlines for volunteer firemen, is that afforded by the National Fire Service Training Association...

Since most volunteer firemen find it impractical to travel any distance for training purposes, any program which offers 'hometown' instruction through qualified local or itinerant instructors have met with greater success than have any other type of fire service training except extended residential enrollment in schools offering fire service instruction."

C. PROGRAMS IN OTHER STATES

There have been many useful developments in procedure and approach to fireman training problems by the various states of the union. This study makes no attempt to list all of these, or even most of them, but rather attempts to indicate general areas of importance which it is felt deserve immediate consideration, and ultimate implementation, in Utah. Those procedures and methods of other states which are included are not intended to be all-inclusive, but merely suggestive of those improvements required to improve the existing training program. As they appear in this study, these suggestions from other states are, on occasion, modified by the expert opinions of the advisory panel members.

The following areas were indicated by various states as being important aspects of a well-developed state-level fireman training program and are considered to be essential in Utah:

1. A concentrated, state-coordinated program of public relations;

2. A complete set of forms and procedures;

3. A complete system for the state-local exchange of information;

4. Adoption of the Oklahoma Training Manual;

5. A change in the basic organizational structure of the volunteer fire department; and,

6. A systematic attempt to convert the local departments to the need for adequate fireman training.

1. PUBLIC RELATIONS

In planning a concentrated, state-coordinated program of public relations, the following subject headings must be included: Constant and organized participation in the Utah Municipal League by the various state agencies concerned with fire fighting and fire safety; issuance to local papers of state-supplied publicity releases on a regular basis; education of local departments in the need for, and methods to achieve, good departmental public relations; thorough home inspection programs designed to acquaint property owners with basic principles of fire safety; a film and lecture series on fire safety delivered at various

local service and special-interest club meetings and at churches; and the establishment of a citizen's fire safety advisory committee in each locality. A brief discussion of each of these subject headings follows.

a. The Utah Municipal League-- several of the responding states indicated their adoption of some means of communication, on a regular basis, with the local civic leaders throughout the state. It was suggested by members of our own advisory panel that a convenient and effective forum through which the local civic leaders may be reached is providdd by the Utah Municipal League. Since the active moral and financial support of a community's leaders for the fire department in large part determines the effectiveness of that department, this is an important avenue for shaping civic support which should be utilized to the fullest extent. The subjects which may be presented in the various departmental meetings and workshops would include the insurance rating schedule for the rating of the various towns and cities, the necessary factors for good fire safety, the need for control of the fire departments by the city governments, and the probable dollar savings effected by improving the level of training of their departments and the fire safety position of their towns and cities. Such state-level leadership may well effectuate substantial change of attitude among the civic leaders, and probably would increase their awareness of the fire safety requirements of their respective areas.

b. State-supplied publicity releases - Many of the states contacted have well-developed programs which regularly disseminate fire safety information to the newspapers and other mass communication media throughout the state. Information concerning fire safety and costs of fire protection provides interesting filler for most local newspapers. Information about each particular local department, or about local costs, fire insurance ratings, and fire safety accomplishments constitutes sought-after news. The responding states seem to feel that such a far-reaching program has several beneficial results: (1) it educates the public as to the needs, accomplishments and problems of the fire service; (2) it teaches the public the essentials of fire safety; (3) this increased public knowledge in the fire safety area often results in an upgrading of the fire service provided in the area; and, (4) the lines of communication between the State Fire Marshal (assuming the releases originate in his office) and the public in general through the news media are kept open and constantly reinforced through use.

c. Public relations education - local departments could do a great deal, as will later be shown, to improve the support they receive from their communities and local leaders. The most important, and obvious, things a department can do in this regard is to have an adequate fire safety program, and be able to put out fires when they do occur in as efficient and professional a manner as possible.

Assuming this ability, there is a great deal of self-help which is possible and open to a department. According to members of the panel, many of the departments never do anything to consciously improve their relations with their community, and this largely because they either don't know improvement is needed or they don't know how to obtain improvement even if the need is felt. Many states have one or more courses included in their fire training curriculum dealing with public relations. An example is this course description, taken from the manual describing the training program in the State of Washington:

Public Relations I — 3 credits

Public relation methods and techniques as it pertains to the Company Officer. Telephone manners, press and radio contacts, general principles of meeting with the public.

Public Relations II — 3 credits

Types of public relations programs. Effective use of the press, radio and television, and Fire Prevention programs as a method of public relations. Promotional programs effecting public relations of the Fire Service.

Such instruction is needed in Utah, and should be included in the regular content of the material presented to the local fire departments.

Additionally, forms for press releases concerning local departmental functions and activities (completion of unit training, inauguration of a home inspection program, etc.) should be provided each department for guidance in submitting information to the news media. A sample of such form, taken from that used in Minnesota, follows.

State of Minnesota
Department of Education
Instruction Division
Vocational Section
Trade and Industrial Unit

N E W S R E L E A S E

The 1. under the direction of Chief 2. has just completed the Course in Firemanship Training as provided by the Trade and Industrial Unit of the Vocational Section, State Department of Education.

This course consists of a minimum of twelve hours of instruction and is presented with the cooperation of the local school officials.

Instructor in the training was 3. and those enrolled from the local fire department were: 4.

1. _____Fire Department
2. Name of Fire Chief
3. Name of Instructor
4. List all class participant's names

d. Home inspection programs - It is felt by several of the states responding, and by several members of the advisory panel, that a good home inspection program serves many purposes. These purposes may be briefly summarized as follows: (1) it acquaints property owners with the basic principles of fire safety and enables them to be aware of the fire safety problems upon their property; (2) it acquaints the local fire departments with the property they protect, thus possibly saving several minutes during the early critical stages of a fire; and, (3) it puts the fire department in public view and develops interpersonal relationships between department members and the individual citizens having their property inspected. Such close contact tends to eventually increase public support of the local fire safety program.

e. Film and lecture series - films and lectures at clubs, churches, and other organizational groups prove to be invaluable tools for building in the public an awareness of good fire safety practices in several of the states. There are almost 30 films available for department use from the Utah Technical College at Provo. Several of these would be excellent for use with PTA groups, service clubs and church groups. There are others which should be added to the state film library. Having members of the local department or members of the state instructional staff as the speakers in these programs adds the personal touch necessary in this situation. Standard meeting plans and topic outlines should be drawn up and made available to each department. If these programs are well-planned, snappy and short, they have been elsewhere, and probably would be in Utah, both effective and well received.

f. Citizens Fire Safety Advisory Committees - this means of obtaining community support for the local fire department was suggested by several of the fire chiefs in their questionnaires and by several of the states responding to our letter of inquiry. The committee would be chosen from the leading citizens of the community and would function as a sounding board for public opinion. The committee would appear to be a useful tool in the fire safety area, for by sponsoring home inspection programs by various high school groups and by sponsoring other fire safety projects, a keener public awareness of fire safety would probably result. The committee could also serve as a molder of public opinion and as a lobbying group to secure the passage by the local governing body of measures to improve the fire department and its fire safety program.

2. FORMS AND PROCEDURES

While the present training program can perhaps be adequately controlled and coordinated through personal contact and the minimal amount of printed material now in use, the necessary expansion of the program will make almost mandatory the publication of a complete set of forms and procedures for its systemization and standardization. Even at the present time, it is difficult for a local department to know exactly those services and facilities which are available for its use. A bare

list of courses offered, with no description thereof and no explanation as to time and facilities required, is all that is presently available. Any expansion of the program effected will make it even more difficult to know what is offered. It therefore appears that a more precise and organized system of informing the departments of the opportunities for learning provided them by the state and of controlling and coordinating such learning opportunities is needed. The following areas require separate consideration: A descriptive catalogue of course and film offerings; course outlines and instructor's guides; field instructor's policies; and generally available means for course requests to be made.

a. Descriptive catalogue - A descriptive catalogue of the fireman training program should include a general discussion of the operation of the program and its overall objectives, and a brief description of each course offered. With such a catalogue, individual firemen and departments would be able to see at a glance that which is applicable to their particular situations and needs. The catalogue would also tend toward a standardization of the entire program and would help to make it more an educational offering and less a stop-gap training effort. Such catalogues are in general use by the colleges and universities in this country, and by many of our vocational-technical schools. The sponsoring institution (Utah Technical College, Provo) has an excellent descriptive catalogue of this nature which could well be used as a standard.

A sample course listing in the catalogue would perhaps look like this excerpt from the Georgia descriptive pamphlet:

> Unit 1c. Hose practice. Actual practice training in the use and care of hose, hose accessories, and hose adapters as: drills in selecting and identifying various sizes, types and materials used in the construction of hose used by the local department; making and breaking couplings using various one and two man methods; attaching and removing hose adapters such as nozzles, wyes, siamese, reducers, and other adapters as used by the local department; attaching and removing hose accessories as used by the local department such as hose roller, hose jacket, hose clamp, chafing block, spanner and hydrant wrench, and rope, strap, and chain hose tool; making the one and two man single and twin donut-roll, the self-locking roll, and the bundle-fold; practicing hose carries, drags, and raises, including carrying the nozzle end, the shoulder fold carry, the shoulder loop carry, the shoulder loop drag, and the street drag, advancing hose up stariways, ladders, fire escapes, and the side of buildings; loading hose onto apparatus using horseshoe, flat, and accordian load; holding and maneuvering charged and uncharged hose lines using one, two, three, and four man method; and testing, setting up and maintaining records of such tests of fire hose.

Texts and visual aids:

Hose practices: International
Handling hose and ladders: NFPA
Fire stream practices: International
Care and maintenance of fire hose, (film): Firefighting films
Hose appliances, (film): LAFD
Hose: Basic operations in hose handling and hose laying, (film): LAFD.

A less extensive course description might be as effective, as this excerpt from the Washington pamphlet demonstrates:

Fire Protection Equipment and Systems 3 credits

Topics discussed include portable fire extinguisher equipment, sprinkler systems, protection systems for special hazards, and fire alarm protection systems. Opportunities are afforded for visits to local facilities that have fire protection equipment and systems in order that critical appraisals can be made.

Films constitute an effective means of instruction for departments and at the same time can be very persuasive public relations tools. In order for the films presently owned by the state to function in these capacities, they must be readily available to all who would use them. The present film listing is merely a table of contents, givng the title of the film and nothing more. In any listing of available films the following information should be provided: The title of the film; the type of equipment required for its showing; its running time; a brief synopsis of the film; and, the type of group for which it is best suited. In addition, the procedure necessary to obtain a film should be clearly set forth, and an order form should be provided with each film list.

An example of what is considered by the writer to be a suitable film listing is provided by the State of Illinois:

CRIMES OF CARELESSNESS 16 mm B. & W. Sound Running time, 10 minutes

This fire prevention film depicts the appalling loss of life and property that results from preventable fires. It contains spectacular pictures of actual fires and will convey a moving message to young and old.

FOR: Fire departments, general public and civic organizations.

FIGHTING TANK FIRES 16 mm Color Sound Running time, 25 min.

Explains the proper methods of dealing with large oil tank fires; how to position crew, choose nozzle size, lay lines and move in.

FOR: Fire departments.

b. Course outlines and instructor's guides - While it is true that two teachers will teach the same class in the same way, it is evident that some direction must be given to the state fire instructors if standardization of instruction is to be achieved. Asking an instructor to teach (for example) a course in hydraulics, without further guidance or clarification, will probably result in a class modeled upon one in which the instructor learned hydraulics, modified to some extent by that instructor's own experience and personal preferences. If all of the state instructors learned hydraulics in the same classroom situation, at the same time, and if their subsequent experiences in the area were similar, then perhaps all instruction offered in hydraulics in the State of Utah would be fairly uniform and standardized.

Assuming that such coincidence of learning experiences does not exist now among the instructional staff, and that it will not exist in the future, some form of instructor's guide or outline for each course offering ought to be devised. These instructor's guides should be fairly specific, and should include the following information: Every topic and subtopic to be covered in each class period; a suggested approach and method of teaching for each topic; and, the visual aids and demonstration materials required for each class period which must be provided by the instructor. Several states have excellent instructor's guide sheets and lesson outlines; one of the most complete is that developed by the State of Wisconsin. Other states having well-developed lesson plans include Illinois, Minnesota and Pennsylvania. A sample page from Wisconsin's lesson plans is shown on the next page.

c. Field instructor's policies - a formal statement of the field instructor's policies is an effective means of enabling the senior or supervising instructor to control the activities of the other instructors and of informing various instructors of that which is expected of them. Such a statement would serve to avoid needless procedural delays and inconveniences. An example of such statement of policy is furnished by the State of Minnesota, and is contained in Appendix B. While such a measure is perhaps not required at the present time with Utah's limited instructional staff, any expansion in the program will necessitate more formalized procedures.

d. Course requests - It is important that formal written requests be made for state itinerant fire instruction. This will enable the instructional staff to schedule classes in advance and to make efficient

WISCONSIN FIRE SERVICE TRAINING LESSON PLAN

CODE S P 1
TIME 2½ HOURS

COURSE: STANDARD
LESSON: HOSE AND FIRE STREAM PRACTICES
EQUIPMENT REQUIRED:
PUMPER TRUCK, 2½" HOSE (UP TO 20 LENGTHS IF AVAILABLE), 1½" HOSE, ALL TYPES OF NOZZLES USED BY THE DEPARTMENT PITOT TUBE AND GAUGES (IF AVAILABLE), OTHER HOSE APPLIANCES USED BY DEPT. (HOSE JACKET, CLAMP, HOSE STRAPS, SPANNERS, ETC.). THIS IS A "WET" DRILL, WATER WILL BE USED.

INSTRUCTOR"S NOTES	TEACHING POINTS
	Objective; To develop proficiency in getting effective hose streams into operation and the handling and care of fire hose, nozzles and related equipment. 1. Introduction Start with short talk on handling and caring for fire hose. Discuss straight and reverse lays; the need for using pumpers on hydrants; how couplings can be damaged, how hose can be damaged; why hose should be cleaned and dried after use. 2. Laying or stretching hose lines Explain and show how hose should be removed from apparatus. 1. Reverse lay 2. Straight lay Note: Emphasize that they must pull off sufficient hose to reach all parts of the fire. Better to have too much than too little. How could you estimate amount of hose needed? From front door of building, allow one length for each floor plus one extra. Example: Fire on third floor, three plus one, or four lengths. Why? Because the line may have to be taken to back of building or to floor or floors above fire. 3. Hand stretch Have them pull off and stretch by hand about ten lengths - one man to each length. Advance dry line to point of operation. Walk rapidly, don't run (leave line laid out).

use of their time and effort. Having a formal means of requesting instruction together with an adequate catalogue describing the courses available should encourage the various departments to request instruction and will undoubtedly lead to a more professional type of instruction. Several kinds of course request forms are included in this report in Appendix C.

3. STATE-LOCAL EXCHANGE OF INFORMATION

At the present time, the local departments are not required to submit annual reports to the State Fire Marshal; those reports which are made are entirely voluntary. In order to adequately plan for the future development of the fire service and to be completely informed of the status of the fire safety program in the state, such reports should be made mandatory. A reporting form should be devised and sent to each department at the end of every year. Such reports should include information on the percentage of each type of fire occurring in the particular area and the percentage of false alarms turned in. Also, any efforts of the department in the fields of fireman education or public safety programs should be reported.

The advisory panel suggested that reports of difficult or unusual fires be sent to the State Fire Marshal on forms provided for that purpose. There would thus be a readily available pool of information on the major fires in the state and the methods used to combat such fires. The Fire Marshal could periodically distribute a newsletter which discusses recent fires and the firefighting methods used in controlling them. These reports could then be read and discussed in a local training session, thus enabling all departments to learn vicariously from the experience of one.

Local problems in fire fighting might also be brought to the attention of the proper state authorities through these reports, if those problems appear incapable of local solution. An example of such local problem requiring a state-level solution is the occasional grass fire caused along the railroad right of ways in the state when the weed-control efforts of the railroads are not current. In such a situation, state-level pressure on the offending railroad might be more effective than any influence the local unit of government could bring to bear.

4. TRAINING MANUAL

The manual of instruction used at the present time in the Utah training program is a three volume set originally compiled by the Salt Lake City Fire Department over 15 years ago. According to members of the advisory panel, the manual is outdated and obsolete in many respects, and a thorough updating and re-editing would be an expensive and time-consuming project. Even then, the finished work would not be any better than some already existing manuals, if as good. After

an intensive review of many training manuals in use throughout the country, it is the opinion of this writer, and of the members of the Ad Hoc Firemen Training Advisory Panel, that the manual "Fire Service Practice for Volunteer Fire Departments, " published by the Department of Fire Protection, Oklahoma State University, and validated by the International Fire Service Training Association, is best suited for our purposes in Utah. The manual is complete and comprehensive, and yet has the advantages of simplicity, clarity and brevity necessary for its use in volunteer departments. The Oklahoma manual is updated and revised each year by acknowledged experts in firemen training, and more advanced manuals in specific areas are readily available from the same source, if required. Another excellent manual considered, but found to be too detailed and extensive in its coverage for its intended use, was the "Fire Service Training" manual, published by the Ohio Trade and Industrial Education Service, Ohio State Department of Education.

5. ORGANIZATIONAL STRUCTURE

The local fire department should be regarded as a part of the city government and should be subject to the supervision and control of the local governing body. There is a general tendency, according to several of the members of the advisory panel, for a volunteer fire department to be more a private club and less a functioning unit of the local government. This should not be the case. Even though the volunteer firemen are donating their time and best efforts to improve the level of fire safety in their towns and cities, in most cases as a public service, the service they perform is one which is of vital importance to their community. As such, the final responsibility for the successful operation of the program should rest in that body most responsive to the desire and control of the public - the elected governing body of the community.

As the local governing body assumes the ultimate control of the fire department, it also must assume the responsibility for several important areas of fire safety and protection. Three of these are: The appropriation of sufficient funds for the fire department; the permanent appointment of the department's fire chief; and, the constant review of the community's fire safety posture.

a. Appropriation of funds - it is important that the fire department be adequately supported financially, as well as morally, by the elected governing body of the community. The provision of appropriate fire-fighting equipment is important in this regard, but equally important is the provision of compensation for at least the out-of-pocket expenses incurred by the individual firemen in participating in training programs or otherwise preparing themselves to be more effective as fireman. Volunteer firemen should no longer be expected to pay for their own operations or to lose time from their work for training purposes without receiving compensation therefor from the community.

b. Appointment of the fire chief - at the present time, there are many fire departments in the state in which the members of the department elect a new fire chief each year. Thus the most popular and not necessarily the most efficient and capable man is placed at the helm of this important community service, by individuals who are themselves not accountable for their actions to the community as a whole. This arrangement tends toward the establishment of cliques and encourages actions prompted by self-interest on the part of the firemen. Perhaps the most serious defect in this situation is that no one man is in office long enough to learn all that is required of an effective fire chief. The training program of the department is among those areas of fire safety which suffer because of this practice of annually electing the fire chief.

The permanent appointment of the fire chief by the local governing body is a change much to be desired. This is the practice in several of the responding states, and the advisory panel has recommended that this method of fire chief selection become the rule in Utah communities. A chief selected in this manner would be subject to removal only for cause, and would therefore be able to give the continuity and direction needed by those programs which are important to the overall fire safety of the community, (i.e. training, inspections, public relations, etc.).

c. Review of the local fire safety posture - fire insurance rates are determined, in part, by the rating received by the area in which the home or business is located. Thus, the better the fire protection available in a given community, the lower the insurance premiums paid by the local homeowners and businessmen. The Utah Fire Rating Bureau which is charged with the responsibility of rating the towns and cities in Utah for fire insurance purposes, attempts to regrade every area in the state at least every ten years. The bureau is suffering from quite a backlog, however, and generally can regrade only those areas which formally request such re-examination. It would therefore be much to the advantage of every city or county government to be aware of those factors which are determinative in the establishment of the rating schedule, and to seek actively to improve the rating which has been assigned to their territories. Once improvements in specific areas have been made, it is important to make a formal request for a re-evaluation of the local rating. In a number of cases, even a slight improvement in a particular classification would be enough to raise the area's rating one class, with a resulting savings in premiums paid flowing to each property owner in the regraded area. This savings in insurance premiums paid, resulting directly or indirectly from a well-developed training program and consequent public awareness in the area, is nowhere more dramatically demonstrated than by the example in Florida. According to W. H. Barnett, Superintendent of the Florida State Fire College in an article in the November 1960 issue of

"Firemen" magazine, the insurance rate reductions for the years 1949 through 1959 represented premium dollar savings to Florida policyholders of over fourteen million dollars ($14,000,000). The committee report from which Mr. Barnett obtained his figures went on to say:

> "While it is perhaps impossible to measure the exact influence the Florida Fire College has had on rate reductions through the part it plays in the fire service, it might at least be assumed with authority that the State Fire College has played an important role in securing lower insurance rates through teaching effective techniques for saving life and property from loss by fire."

6. DEPARTMENT "CONVERSION"

While much could possibly be written about the need which exists in this state for an adequate means of convincing many of the local departments of the desirability of the state itinerant instructional program, an attempt will be made here at brevity.

According to the present state fire training instructor, it is often difficult to induce some departments in the state to accept his services (a fact for which he is, in one sense at least, grateful. His backlog is even now quite considerable, and a period of waiting for his services of from one to three months is not al all uncommon). At the present time, it is perhaps best that more effort is not expended in this regard, as the limited capacity (quantitatively) of the present instructional staff is evident. But as the present staff is expanded to meet the present and future needs of the fire service in Utah, the capacity will be great enough to enable the instructors to concentrate on providing some measure of training for every fire department in the state.

The reluctance of the various departments to participate in the state instructional program cannot be adequately explained, as the reasons therefor are as numerous and distinctive as the departments giving them. Some departments may not want instruction from "outsiders", some may feel their level of training is adequate, some may not even be aware of all that is offered by the state program, and some may not know the ease with which the services of a state instructor may be obtained. Whatever the reason for not requesting state instruction, the obvious goal of an effective state instructional program must include the training of every department in the state. This, evidently, was the conclusion of those in charge of the training program in Wisconsin, and the results of their program to sell fireman training to the volunteer departments of their state are stated in the annual descriptive report for Fire Service Training for the fiscal year ending June 30, 1966:

"A 'foot in the door' approach was quite successful in reaching volunteer fire departments which had never requested training. They were offered the free services of a qualified speaker at one of their regular meetings. Our part-time instructors were the speakers. Each gave a one-hour lecture on firefighting with emphasis on the value of training. The speaker concluded by pointing out how easily this training could be obtained from the state and gave the fire chief an application blank. Sixty-two fire departments, which had never asked for training, accepted this offer and ninety percent of them subsequently sent in applications for training."

Note: Although the fire losses in the nation have mounted considerably in the past three years, Wisconsin's fire losses have declined."

It might be noted that there are several films available which are designed to stimulate volunteer fire departments to accept training, and that these could be used in lieu of, or in addition to, lectures by state fire instructors at such fire department meetings.

CHAPTER IV

RESEARCH RESULTS

A. QUESTIONNAIRE RETURNS

Questionnaires were sent to the chiefs of each of the fire departments in the state, both full-time and volunteer. Of these, 43 were completed and returned by the volunteer departments, and five by the full-time departments. The rate of return by the volunteers was 33.1% (43/130) and that by the full-time departments was 62.5% (5/8). The combined rate of return for all departments was 34.8% (48/138). The low rate of return from the volunteer fire departments may be due in part to the rapid and constant change-over of department chiefs. As pointed out earlier, the list of chiefs used was fairly recent, and yet it was two or three chiefs behind in several instances. It thus appears that many of the questionnaires never arrived at their proper destinations, as the person to whom they were sent neglected to forward them to the new chief or misunderstood their nature. The low return rate may perhaps also be explained by the reticence of many of the relatively inactive or inept departments to report such inactivity or ineptness. This conclusion is the result of the subjective impression of this writer that most of the replies were from the better or more active departments. Other factors producing the low return may have been procrastination, loss or disinterest. The conclusions indicated by the returned questionnaires are presented below. The complete returns are included in this study as Appendix D.

It would first appear that there are few, if any, facilities in the state which can provide actual fire-fighting experience for firemen. Of the departments responding, none had a drill tower, one reported a fire test building (indicating that the term was misunderstood by the respondent, as this writer is unaware of any such facility in the entire state). 10.4% reported having smoke houses, and 18.8% reported having flammable liquid installations.

It must be noted here that the comments of the responding fire chiefs must be given a great deal of weight in this study when they correspond, since no specific responses were sought. If, for example, 20% of the chiefs make the same comment, where none is required, the point must be of substantial import, and would probably have been checked by a far greater percentage of the chiefs had it been listed as a part of the questionnaire.

With this in mind, it is noteworthy that 56.3% of the responding fire chiefs commented that actual fire conditions were needed to adequately prepare their firemen to fight fires effectively. Less than

50% of those responding reported having received at least some state-provided training within the previous two years.. The comments with some recurrence in the individual responses were: Need much more training (18.8%); need actual fire training (31.3%); and, need better training facilities (27.1%).

When asked to rate their department's level of training for all classes of fire, 10.4% of the chiefs felt a need for more state training, 13.5% felt there was inadequate time available for proper training, 27.1% stated a need for actual experience and for better training facilities, and 10.4% felt the level of training was as good as could be expected. Thus many of the chiefs feel a need for more and better training than they have heretofore received, and few feel their departments to be completely competent as firefighting units.

The presence of compensation, at least for out-of-pocket expenses, would make a significant difference in the willingness of volunteer firemen to attend a 3-7 day course at a permanent state fire school. When asked to indicate the percentage of the men in their respective departments who would attend such a school, the chiefs indicated that the upper three percentage categories (30% - 40%, 40%-50%, and over 50%) would show a 43.7% increase in attendance from the absence to the presence of compensation. In their comments to the question, 68.8% of the chiefs indicated that compensation would definitely make a difference.

As to the willingness of their men to attend weekend regional courses, the responding chiefs indicated that compensation would not be as significant an inducement as it would be for attendance at the state fire school. The upper three categories showed an increase of only 16.8% from the absence to the presence of compensation. Perhaps with reimbursement merely for travel expenses, this difference would be reduced even more.

The need for a concerted public relations campaign to educate the public and the community leaders as to the training needs and accomplishments of the volunteer firemen was indicated, in some manner, by most of the chiefs responding. (See Appendix D). The suggestions for such a campaign ranged from state-level coordination and supply, to home inspection programs, to selecting a citizens fire safety committee in each community. All respondents appeared to feel the need for better and more systematic communications between the local fire department and the community it serves. The sentiment seemed to be that if such communications were improved, the moral and financial support received by each department from the community would shortly be forthcoming.

Concerning the desirability of the various levels of training, 81.3% of those responding indicated a need for a permanent State Fire

School; 35.4% favored regional fire schools; and 58.3% favored classes in each individual department, provided (as is presently the case) by the state on an itinerant basis.

The comments to the question indicated that 37.5% of the chiefs felt a State Fire School was needed to provide actual firefighting experience; 33.3% felt such a school would provide a better quality of training than is presently available; and 25% felt it to be a necessity for the State to have such a permanent facility. Travel considerations would make regicnal schools preferable to a centrally located state fire school, according to 16.7% of the chiefs. The following reasons were cited in support of an itinerant training program reaching the local levels; need to train with own equipment (4.2%); distances make local training the only feasible (10.4%); inability of men to leave jobs for state or regional schools (12.5%); cannot leave city unprotected while men are attending a state or regional school (4.2%); and there will be a better response in attendance with local classes (18.8%). Nearly 21% of the chiefs felt a need for all three levels of instruction.

The questionnaires demonstrate that:

1. The physical facilities for the training of the volunteer firemen in the State of Utah are not at all adequate to meet the present need, and that permanent State facilities for such training are in order;

2. some form of compensation paid those volunteer firemen attending a state fire school would substantially lessen the burden of such attendance and increase the percentage of firemen able to participate in the training;

3. there is a definite need for more and better training than that which has previously been available to the volunteer departments;

4. compensation would make little difference in the willingness of the volunteer firemen to attend a regional fire seminar;

5. there is a substantial need in the state for a concentrated program of public relations and education; and,

6. all three of the various methods of firemen instruction (State Fire School, regional fire seminars and local itinerant instruction) are needed in a well-developed training program.

B. RATING COMMITTEE RESULTS

The ad hoc rating committee divided the cities and towns of Utah into four categories, utilizing the ten-class rating schedule of the Utah Fire Rating Bureau in roughly the following manner: First through

fourth class cities-Class A; fifth and sixth class cities-Class B; seventh and eighth cities-Class C; and, ninth and tenth class cities-Class D. The most efficient fire departments would be in Class A, and the least efficient would be in Class D. The rating resulted in the following division among the four classes: Two departments (1.5%) in Class A; eight (6.1%) in Class B; fifty (38.2%) in Class C; and seventy-one (54.2%) in Class D. These figures include full-time departments but exclude departments at federal installations and those at private institutions, such as Thiokol or Hercules.

It appears first of all that some objective means of rating the various volunteer departments in the State must be developed. In this way, weaknesses may be strengthened in each department and all departments may be graded according to their training level in relation to the other fire departments in the State. The important goals of standardization of training and levels of ability, and the upgrading of the entire fire service in the state will be more easily achieved by this rating. Instructors and teachers in other educational endeavors are expected to give grades to their students upon completion of a course of study, and there is no reason why the state fire instructors should not grade each fire department which completes a prescribed course of study (assuming a fairly objective grading scheme can be devised for the instructor's use).

The rating committee thus placed 92.4% of the fire departments in the state in the lower two classes, when rated for efficiency in fighting fires. Substantial improvement in this area is vitally important, and can be largely effectuated by improving the quantity and quality of the training available to, and actually received by, the volunteer firemen throughout the state. Such training will not only increase the ability of each fireman, and each department, to fight fires, but will also acquaint the firemen with the necessities of fire protection for their own cities (adequate water system, effective fire code, alarm systems, most effective equipment for fighting fires, etc.) and therefore will ultimately result in better all-around facilities. The final result of such an occurrence will tend toward better fire protection, better insurance rating for each city, and a consequent out-of-pocket insurance savings for every citizen.

C. SURVEY OF STATES

In the survey made of practices in other states, much helpful information was obtained. The response was very good, with thirty-one of the thirty-seven states contacted responding (83.8%).. The complete returns are included in Appendix E. The percentages listed in the following material were obtained by dividing the number of states in each category by the total number of states responding to our inquiry.

Eight states (25.8%) reported having a permanent state fire college, nine (29.0%) reported permanent sites either under construction or in the planning stage, and fourteen (45.2%) reported no permanent state fire college. It is understood that two other states, Iowa and Texas, have permanent fire training facilities and that two states, Arkansas and Indiana, are currently seeking legislative approval of plans for such facilities. Thus, if this information is correct, there are ten states (28.6%) which have permanent state fire schools, eleven states (31.4%) which are planning to construct state fire schools, and fourteen states (40.0%) which have no schools and no plans to construct one. Thus, twenty-one states (60.0%) have decided a state fire college was necessary for their training program.

Five states (16.1%) reported that associate or bachelor degrees are offered. Four (12.9%) more indicated that plans for such programs are being developed, bringing the total number of states regarding degree programs as important to nine (29.0%).

Twenty-five states (80.6%) reported having itinerant training programs. Thirteen states (41.9%) reported using the Oklahoma Red Books as their training manuals, three (9.7%) used the Ohio training manual, three (9.7%) used Maryland's, one (3.2%) used manuals published by the International Association of Fire Chiefs, five (16.1%) used their own manuals, three (9.7%) used those published by the National Fire Protection Association, and twelve states (38.7%) did not respond.

The trend in firemen training throughout the nation appears to be toward a higher level of education and a professionalization of the fire service. The feeling is growing that a fire service should be more than a mere vocation - that it is in reality a profession requiring more than mere manipulative skills. The growth of the advanced degree programs attests to the strength of this feeling.

It is being recognized that the state governments must take a more active part in the training and education of the firemen serving in the local communities, and that state instructional programs eentered around a permanent state training facility are essential (retaining of course the itinerant and regional programs which are basic to any such program). The substantial shift to permanent state fire schools demonstrates that other states are realizing that actual experience and exposure to fire conditions are essential prerequisites to a well-trained fireman, and that such prerequisites cannot be achieved in the traditional local-level training programs.

CHAPTER V

CONCLUSIONS AND RECOMMENDATIONS

A. CONCLUSIONS

1. The training program as it now exists in Utah is not meeting the needs of the fire departments in the state, despite the very able work of the small state instructional staff.

2. The training program suffers from:

A. A decided lack of physical facilities (such as training towers, fire test buildings, etc.);

B. An insufficient number of state instructors to carry the training program to the various departments;

C. An inadequate system of public relations;

D. A rudimentary system of forms and procedures which fails to fully inform the local departments as to the services and facilities available to them;

E. An inadequate exchange of information between the local and state levels of the fire service;

F. An outdated training manual;

G. An inefficient form of departmental organization;

H. A partial lack of desire on the part of the local departments to participate in a complete training program (although it must be noted that working conditions, job requirements, and inadequate time contribute to this lack of desire).

B. RECOMMENDATIONS

It is recommended that:

1. A permanent State Fire College be constructed and made available for the use of all fire departments in the state.

2. Two or more additional full-time State Fire Instructor positions be created.

3. A concentrated, state-coordinated program of public relations be planned and implemented, using some or all of the following methods and forums:

A. The Utah Municipal League
B. State-supplied publicity releases
C. Public relations education of the firemen in the state
D. Home inspection programs
E. Film and lecture series
F. Establishment of local Citizen Fire Safety Advisory Committees.

4. A complete set of forms and procedures be developed, including:

A. A descriptive catalogue of the training program and the courses offered

B. A descriptive listing of the films available for departmental and public relations use

C. Course outlines and instructor's guides

D. A statement of policies for field instructors

E. Course request forms and more formal procedures for the requesting of courses

5. A more complete state-local exchange of information be implemented.

6. The Oklahoma manual be adopted for use in the training program.

7. The local fire departments be made subject to the supervision and control of the local governing bodies, placing in such governing bodies the responsibility to:

A. Appoint new fire chiefs, who will be subject to removal only for cause; and,

B. Adequately finance the activities of the department, including all training activities.

8. A program designed to sell the need for complete departmental training to the various fire departments and civic officials in the state be implemented.

9. Further research be conducted in the following areas:

A. Possible implementation of a two-year associate degree program in fire science and/or fire technology, with courses taken at both the itinerant and state fire college levels being credited toward completion of the program;

B. Specific teaching aids and methods required for each course and topic in an effective fireman training program;

C. A permanent follow-up program on the effects of an improved instructional program (studying reduced insurance rates, increased efficiency, lower fire loss, etc.); and,

D. The development of an objective rating system to grade fire departments on the basis of efficiency and skill in combating fires and functioning as fire safety units.

APPENDIX A

U T A H

S T A T E F I R E

C O L L E G E

1967

DEDICATED TO THE SAVING

OF LIFE AND PROPERTY

UTAH STATE FIRE COLLEGE

Orem, Utah

Wilson W. Sorensen, President
Roger Honeyman, Director, Off-Campus Training

PURPOSE

The purpose of the Utah State Fire College is to provide instruction and training for paid, volunteer, institutional and industrial firemen; develop new methods and practices for fire fighting and fire prevention; to assist the State of Utah and county, municipal, and other local governments of Utah and their agencies and officers in their investigation and determination of the causes of fires; to provide facilities for testing fire fighting equipment; to disseminate useful information on fires, fire fighting and fire prevention, and other related subjects, to fire departments and others interested in such information; to do such other needed or useful things necessary to the promotion of public safety in the field of fire hazards and fire prevention work.

SUPERVISION

Operation of the Utah State Fire College is under the direct supervision of the Utah Trade Technical Institute, in cooperation with the office of the State Fire Marshal.

The supervision and operation of the Fire College is directed by a superintendent appointed by the President.

CURRICULUM

The Utah State Fire College conducts several phases of fire service training. Classes are held at the Fire College in Orem and in the field at various fire departments, industrial plants, institutions, etc.

UNIT TRAINING includes several ( ) hour units of instruction and one week is required to complete each unit. These units are divided into two groups--the ONE HUNDRED (100) series, covering subjects all firemen should know and the TWO HUNDRED (200) series, which becomes more technical, covering subjects designed for officer level and special services. All units are taught at the Fire College and some can be taught in the field.

ITINERANT TRAINING is conducted in Utah for local fire departments, private fire brigades, institutions and others requiring this type of training. Equipment on hand is used plus portable equipment carried by the instructor. ( ) hours are required for this course and classes are conducted three (3) hours each day or night, Monday through Friday. The regular course includes some training in such subjects as TOOLS, FORCIBLE ENTRY, EXTINGUISHERS, BREATHING EQUIPMENT, HOSE LADDERS, VENTILATION, SALVAGE & OVERHAUL, RESCUE, FIRE STREAMS AND PUMP OPERATION.

Note: Special courses can be arranged whereby more time can be spent on one or more subjects and others omitted.

Field Classes of ITINERANT or UNIT TRAINING may be scheduled by writing the Fire College. When requesting this training, state approximately when you prefer the class to be conducted. A date as near as possible to that requested will be arranged.

SPECIAL TRAINING is conducted in various other subjects which are scheduled in this bulletin.

OTHER SERVICES extended by the Fire College are: Assistance in the inspection of schools, hospitals and other public buildings; advisory assistance in the evacuation plans of hospitals and other institutions, the organization of fire departments, the arrangement of fire prevention programs, the planning of local training programs and every other thing conducive to the promotion of good fire prevention and protection.

CERTIFICATION

Upon completing one ( ) hour class of UNIT TRAINING and passing the written examination, a student is issued a certificate for that unit.

When a student has earned certificates in five different units of either the ONE HUNDRED or the TWO HUNDRED SERIES, he is then awarded a diploma for the series completed. Certificates are also issued for ITINERANT TRAINING but do not apply toward a diploma. Certificates earned in one series do not apply toward a diploma for the other.

ATTENDANCE

Attendance is open to all paid and volunteer firemen of state, county and city organizations; military personnel; fire prevention and safety personnel of industry; and all others concerned with the fire service.

DESCRIPTION OF UNITS

101 TOOLS, FORCIBLE ENTRY, BREATHING APPARATUS, EXTINGUISHERS
Included in this unit are the operation, use and maintenance of various types of extinguishers, fire department tools, and breathing apparatus; ropes and the tying of knots and hitches used in the fire service; latest methods and equipment for forcible entry.

102 HOSE AND LADDERS
The information on ladders includes: types, design and material; handling, raising and climbing; precautions and inspection. The portion alloted to hose covers such items as: fire hose, couplings, accessories and adapters; hose loads and finishes; hose lay-outs, hydrant connections and advancing hose lines; testing and maintenance of hose. Actual drills in the application of this information are conducted.

104 FIRE STREAMS
This unit contains information needed for quick calculations of engine and nozzle pressures. Rouch rules are taught as well as various formulae. Considerable background information is given so that a better understanding of pressure in fluids may be obtained. Students who enroll in this unit must have a working knowledge of Mathematics.

105 FIRE APPARATUS AND PUMPS
The basic operation and in-service maintenance of fire apparatus and pumps is taught in this class. Cutaway models of various types and makes of pumps, pressure regulators, and priming devices are used in order to assure a more thorough understanding of fire pump operation. Included is information regarding pumps of latest design and construction.

106 FIRE INSPECTION
Through this unit a man is taught how to make effective inspections, recognize hazards, and make comprehensive reports and records; is informed of new hazards, new types of hazardous material and new problems in this field. The class will engage in roundtable discussions of inspection problems, and make actual building inspections.

107 ARSON DETECTION
Explained are the principles of recognizing fires of suspicious origin through knowledge of known fire causes; how to determine what is evidence; how to preserve reliable evidence for the professional investigator; how to make pre-

liminary investigations from the viewpoint of the firemen and of the investigator. Case histories applying to the topic are discussed. Demonstrations of flammable liquids and chemicals are conducted. This unit is of value to all firemen as well as to the fire investigator.

108 VENTILATION, SALVAGE AND OVERHAUL
This unit includes the recognition of ventilation requirements; how to ventilate; importance of salvage work; types, sizes and construction of salvage covers; folding, carrying and using salvage covers; removal of water and debris from building; overhaul and clean-up.

108 RESCUE
This unit deals with such subjects as: recognition of rescue situations; conditions in which the victim may be found; rescue procedures and personal protections. REGISTRANTS IN THIS CLASS SHOULD INCLUDE SWIMMING TRUNKS WITH THEIR WORK CLOTHES.

201 INSTRUCTOR TRAINING
This training is for those who are now, or expect to become, engaged in instructional duties to any degree. This includes company officers who are responsible for training the men in their command, as well as the instructors who are responsible for training the entire fire department. Subjects covered include: HOW to teach (not WHAT to teach); improvement in teaching techniques; course outlines, arrangements of teaching material in logical order; use of visual aids in teaching.

202 COMPANY OFFICER TRAINING
The fire officer today must cope with many varied problems and situations. This unit is designed to assist in solving these problems. Subjects covered are: planning, leadership, training men, coordination and supervision, duties and responsibilities.

204 FIRE FIGHTING TACTICS
Every fire officer is constantly faced with the problems of making immediate decisions. In order to assist in making wise decisions he should have a thorough knowledge of the subjects covered in this unit: pre-fire planning, size-up, attack, control and extinguishment of fire using to the best advantage available manpower, apparatus, tools and equipment on the fire ground.

206 FIRE PREVENTION AND PROTECTION
The essential information necessary for fire protection of the average municipality is given in this class. Outlined is a program of fire prevention that will bring good results in the protection of both life and property. To aid in the reduction of hazards and thereby reduce fire losses, information is given on: fire incidents in occupancies; mercantile and industrial hazard protection; storage; public relations and preparing fire prevention programs.

207 FIRE INVESTIGATION
This course is designed to teach firemen the fundamentals of investigation with special emphasis on investigation of the origin and cause of fire. Utah arson laws, preservation of evidence, records and reports, the arson investigation process and other related subjects.

FIRE DEPARTMENT ADMINISTRATION

Administration of a modern fire department has grown to such proportions that it has become quite complex. The following units of training are designed for those who are now or expect to become involved in administrative duties.

208A Included in this unit are such subjects as: analysis of administration; administrative and personnel management; fire defense organization; understanding and handling manpower; fire defense and insurance rates; administrative requirements.

208B This unit contains such subjects as: the fire department organization and promoting team work; basic principles to guide the operation; exercises in large scale operation; water supply; buildings and equipment of the fire department; purchasing apparatus and equipment maintenance of department property; communications; the fire department training program; records and reports; public relations.

SCHEDULE OF SPECIAL CLASSES AND CONFERENCES

Utah Fire Service Training Improvement

Conference

The purpose of this conference is to improve training and education in the fire service; to assist in solving the many problems that confront those responsible for this training. The conference is open to fire chiefs, training officers and all others concerned with training in the fire service of Utah.

Attendance certificates will be issued to those who attend all sessions of the conference.

INDUSTRIAL FIRE BRIGADE TRAINING

Fire Brigade Training is available for industries within the State of Utah. Training requires a minimum of ten hours of instruction for each member of the brigade.

Training covers:

1. Fire prevention as it applies to the saving of life and property, job security and continuity of employment.
2. Plant layout
3. Location and Operation of

    A. Hydrants and Hose Houses
    B. Sprinklers
    C. Standpipes
    D. Extinguishers
    E. Other Fire Appliances

4. Chemistry of Fire
5. Causes of Fire
6. Classes of Fire
7. Types of Extinguishers and their uses
8. Knots and Hitches
9. Using Available Fire Fighting Equipment

    Class "A"
    Class "B"
    Class "C"

The Fire College instructor, if requested, will confer with plant management and the fire brigade on continued fire prevention and good housekeeping practices.

FALL FIRE SEMINAR

This three day conference held in the fall of each year is held for the purpose of acquainting firemen with the latest advances and techniques in fire prevention and suppression. This conference is open to all firemen in the state.

INSTRUCTIONAL AND REFERENCE MATERIAL

Manuals, reference material and work books used for training are distributed by the Fire College. Various text books, publications, informational pamphlets, standards and suggested ordinances obtained from the National Fire Protection Association and other sources, are also available through the Fire College.

APPENDIX B

FIELD INSTRUCTORS POLICIES

1. Field instructors shall keep daily milage data when driving state vehicle. State credit card charge slips shall be turned into the motor pool office or T & I office weekly. Milage record sheet must be turned into the T & I office immediately after the last day of the month.

2. Field instructors shall keep daily meal and housing facilities expense account when in the field. Receipts are necessary for housing facilities expense. Expense accounts are to be turned into the T & I office at the close of each week.

3. When it is necessary for the field instructor to make a long distance or toll telephone call pertaining to his work, he shall use telephone credit card which has been issued to him. A record slip must be filled out for each call and turned into T & I office at the end of the week with his expense account.

4. When a change in itinerary is necessary, while in the field, the instructor shall call his office and advise of the change, and cancel all previous commitments that may be affected by the change.

5. When an emergency arises involving the field instructor, such as sickness or an accident, he must notify by telephone the office and give the particulars. Any class cancellations necessary must be worked out with the office personnel at that time.

6. The field instructors must report into the office or contact the office each Friday afternoon to receive any information or instructions necessary for the following weeks schedule.

7. Vocational Department Staff meeting will be held the first Monday of each month, unless otherwise designated by Mr. S. K. Wick, Director. Each field instructor must make an attempt to be present at each meeting if at all possible.

8. If, during the course of a session of training, the field Instructor shows a film or conducts any other activity not included in the regular training outline, he shall make a notation of the same on the back of the attendance record. In doing so list the name of the film or activity conducted.

9. At the completion of a class session, the field instructor shall make certain that the class attendance record is fully completed and all names are correctly spelled and unquestionably readable. He will then place the attendance record in the senior instructor's work tray.

10. The senior instructor urges all field instructors to discuss with him, any suggestions or constructive criticism they may have relative to the welfare of the firemanship training program.

11. If, at any time, the field instructors have any questions, problems or matters they wish to discuss, the senior instructor welcomes the opportunity to discuss the same with him. The senior instructor will, to the best of his ability, assist in any possible way he can to bring about a suitable solution or decision, as the case may be.

12. Field instructors will be furnished yearly work record forms and shall tabulate information indicated on the form after the completion of each twelve hour course conducted. On May 15, of each year a summary sheet will be issued to each instructor, to be filled out and returned to the office, on or before, June 3, of each year, with a copy of the completed yearly work record form attached. This summary is to include all work completed from May 31, to June 1, of each year.

UTAH STATE BOARD OF EDUCATION

1400 UNIVERSITY CLUB BUILDING • 136 EAST SOUTH TEMPLE
SALT LAKE CITY, UTAH 84111

The enclosed questionnaire is designed to assist in a study of the training received by members of the volunteer fire departments in the state of Utah. Please comment freely on the questions asked and be as objective as possible in your evaluations. Your comments and original thinking in the areas covered by the questionnaire are most important, since you are the fire training and fire prevention expert in your community. It is for this reason that we turn to you and the other fire chiefs in the state for help in upgrading our training program.

Please return the completed questionnaire to:

John F. Stephens, Director
Research Coordinating Unit
Utah State Board of Education
1300 University Club Building
Salt Lake City, Utah 84111.

An addressed and stamped envelope is enclosed for your convenience.

We would appreciate your immediate attention in this matter.

Thank you for your cooperation and support.

Sincerely,

John F. Stephens

John F. Stephens, Director
Utah Research Coordinating Unit

1300 University Club Building, Salt Lake City, Utah 84111

QUESTIONNAIRE

PLEASE DO NOT IDENTIFY YOUR DEPARTMENT BY NAME.

Number of men in your department: Full time _____
Part time or on call _____

Approximate population of area protected by your department ____

1. Check the training facilities now used by your department or those used within the past two years

( ) a. Training or drill tower
( ) b. Classrooms
( ) c. Library
( ) d. Fire test building
( ) e. Standpipe and sprinkler systems
( ) f. Flammable liquid installations
( ) g. Drill area for hose layouts and practices, maneuvering fire apparatus and driver training
( ) h. Smoke house
( ) i. Drafting pit
( ) j. Fire training films
( ) k. Pumping apparatus
( ) l. Other (specify) _____
_____
_____

2. In your opinion, these training facilities are:

( ) a. Wholly adequate
( ) b. Satisfactory but lacking in some essentials
( ) c. Wholly inadequate

Please explain your answer: _____
_____
_____
_____
_____
_____

3. Check the areas in which training has been conducted in your department within the last two years (also indicate whether the course was conducted by your department or by a state agency).

Local	State		
( )	( )	a.	Introduction to Fireman Training
( )	( )	b.	Company Organization and Administration
( )	( )	c.	Utah Laws and Ordinances Related to Fire Departments
( )	( )	d.	County and City Ordinances Related to Fire Departments
( )	( )	e.	Chemistry of Fire
( )	( )	f.	Fire Prevention and Inspection
( )	( )	g.	Personal Safety at Fires
( )	( )	h.	Operating at Fires

( )	( )	v.	Radiation
( )	( )	w.	Public Relations
( )	( )	x.	Communications
( )	( )	y.	Problems of Organizing and Managing a Fire Department
( )	( )	z.	Other (specify)

_____

_____

_____

_____

_____

4. These courses of study as presently available to the men are:

( ) a. Wholly adequate
( ) b. Satisfactory but lacking in some essentials
( ) c. Wholly inadequate

Please explain your answer: _____

_____

5. At the present time (taking into consideration the time available for training, the quality of the training received, etc.) you feel that the level of training for all classes of fire is:

a. Wholly adequate ( )
b. Satisfactory ( )
c. Wholly inadequate ( )

Please explain your answer: _____

_____

_____

6. If there were a permanent state fire college in Utah, offering courses throughout the entire year, you feel that the following percentage of the men in your department would take advantage of a short (3-7 day) course each year:

( ) a. none
( ) b. 0%-10%
( ) c. 10%-20%
( ) d. 20%-30%
( ) e. 30%-40%
( ) f. 40%-50%
( ) g. Over 50%

If they received compensation for their time, the following percentage would attend:

( ) a. none
( ) b. 0%-10%
( ) c. 10%-20%
( ) d. 20%-30%
( ) e. 30%-40%
( ) f. 40%-50%
( ) g. Over 50%

Please explain your answer: _____

_____

_____

_____

_____

_____

7. If a state instructor would come, on request, to your department and teach courses of your choosing, would you prefer classes to be held:

( ) a. Once a month until completion
( ) b. Once a week until completion
( ) c. Four or five evenings during a single week, completing the entire course in that week
( ) d. Not at all

Please explain your answer: _____

_____

_____

8. If a short (weekend) course were offered periodically on a regional basis, with several fire departments in your area being invited, you feel that the following percentage of the men in your department would attend:

( ) a. 0%-10%
( ) b. 10%-20%
( ) c. 20%-30%
( ) d. 30%-40%
( ) e. 40%-50%
( ) f. Over 50%
( ) g. None

Please explain your answer: _____

_____

_____

If they received compensation for their time, the following percentage would attend:

( ) a. 0-10%
( ) b. 10%-20%
( ) c. 20%-30%
( ) d. 30%-40%
( ) e. 40%-50%
( ) f. Over 50%
( ) g. None

Please explain your answer and state your feelings: _____

_____

_____

9. What support does your department receive from your city and/or county officials?

_____

_____

_____

_____

10. How can this support for the activities and business of your department be improved?

_____

_____

_____

_____

11. Is there a need for better public relations between your department and the community it serves?

yes_____ no_____

How might they be improved? _____

_____

_____

_____

12. Please state and explain your feelings on the relative merits of:

( ) a. a centrally located state-wide fire school
( ) b. a regional fire school held periodically
( ) c. fire classes held in each individual department

_____

_____

_____

APPENDIX F

We are now in the process of surveying the training received by members of the volunteer fire departments in our state. Our goal is to devise a comprehensive training program for our volunteer firemen which will most effectively utilize the limited time which they have available.

We have a very limited amount of information concerning your efforts in this regard, and so would appreciate any help you could offer. Do you have a state fire college? If so, how are volunteer firemen included in its program, and what courses are they offered? If not, what type of program do you have for training your volunteer firemen?

Since such information may not be immediately available, my office will be pleased to bear the cost, upon notification, of reproducing the materials which we desire.

I appreciate your cooperation and assistance in this matter, and hope that, if the need arises, you will allow this office to reciprocate. I will forward to you a copy of the completed report, if you so desire.

Sincerely,

Robert W. Pommerville
Research Assistant

ABSTRACT

800 The training of volunteer firemen is a difficult and yet important task, and
801 it can rarely be effectively accomplished by the individual fire departments
802 acting alone. A state-administered training program is a necessity.
803
804 The specific objectives of this study are:
805 1. To ascertain the scope of the fire training programs for volunteer depart-
806 ments presently functioning in the United States;
807 2. To ascertain the scope of the training program for volunteer firemen as it
808 presently exists in Utah;
809 3. To indicate those areas in which improvement of the Utah training program
810 is required; and,
811 4. To offer suggestions for the solution of the various problems uncovered in
812 the study, and new approaches to those problems, whenever the need appears.
813
814 Some of the recommendations made include: The construction of a permanent
815 state fire college; the enlargement of the state instructional staff; the de-
816 velopment of a concentrated, state-coordinated program of public relations and
817 a complete set of forms and procedures; and, subjection of the volunteer fire
818 departments to the supervision of the local governing bodies.

JATC; JOINT LABOR MANAGEMENT APPRENTICESHIP AND TRAINING COMMITTEES

The key to successful area-wide apprenticeship training is the joint apprenticeship and training committee. This committee, equally representative of management and labor, is established to carry out the development and administration of apprenticeship and journeyman training training programs. Major functions of the joint apprenticeship and training committee include selection of apprentices, supervision of comprehensive on-the-job training experience and related instruction, and control of apprenticeship agreements and registration. Guidelines for these functions and others are given in this booklet. Also given are directories of state and regional apprenticeship agencies and national joint apprenticeship committees. (HC)

FOREWORD

The introduction of new processes, automation, technological changes, and requirements for higher skills has created a challenge to Joint Labor-Management Apprenticeship and Training Committees (JATC's) for more effective action to assure adequate apprenticeship and advanced training for journeymen. This challenge is further underscored by insufficient numbers of apprentices, drop-outs before completion of apprenticeship, and poor on-the-job practices and supervision.

More than 9,000 Joint Labor-Management Apprenticeship and Training Committees have been established in all sections of the country. These committees are delegated authority by their respective organizations to set up and conduct apprenticeship and training programs.

The information in this booklet is primarily concerned with area-wide Joint Apprenticeship and Training Committees, as their responsibilities differ somewhat from single plant Joint Apprenticeship Committees. An examination of area-wide programs shows many points of similarity in functions. This type of committee has been in operation long enough to make it possible to set forth in booklet form a guide based on successful experience.

A significant development is the creation by employers and labor of apprenticeship and training trust funds and the employment of national and local apprenticeship directors and coordinators. In the construction industry, there are a number of national directors and more than 200 local JAC's have part-time or full-time directors or coordinators.

The information in this booklet reflects thousands of hours spent by committees in developing quality apprenticeship. We are confident that when these experiences are adapted by conscientious committeemen, JATC's will improve their apprenticeship and training program.

Assistance in establishing new committees and reactivating existing JATCs is available from both Bureau of Apprenticeship and Training and State Apprenticeship Agency representatives.

EDW. E. GOSHEN, *Director*
Bureau of Apprenticeship and Training

THE JATC HANDBOOK

Key to Successful Area-Wide Apprenticeship Training Programs

What Is A Joint Apprenticeship and Training Committee?

A joint apprenticeship and training committee is a group, equally representative of management and labor, established to carry out the development and administration of apprenticeship and journeyman training programs. The committee may represent labor-management interests at the National, State, or local level.

The joint management-labor apprenticeship and journeyman training committee is the key to a successful area-wide apprenticeship and journeyman training program. It is to the program what the manager is to his company's business, or what the business agent is to the union. If the members of a joint apprenticeship and training committee are interested and active, the program is likely to be a success. If the members are indifferent and inactive, the program will reflect their inaction. It is important that the committee be thoroughly familiar with its duties and that each member be aware of his responsibilities.

Principal factors and provisions for a successful area-wide apprenticeship and journeyman training program are discussed in the following pages.

National Committees

National joint apprenticeship committees, composed of national employer association and international union representation, are concerned primarily with developing minimum, uniform apprenticeship standards for the trade and encouraging local management-labor groups to accept these standards as a guide in developing local apprenticeship programs. This national trade approach has proved especially effective in enlisting the cooperation and support of State and local groups.

State Committees

State committees, which also guide the development and operation of apprenticeship, have been established in some of the construction

trades. These committees encourage local organizations to foster and standardize apprenticeship. Where no local organization exists in a particular trade or industry, the State committee may assume some of the duties normally performed by committees at the local level.

Local Committees

As administrator of the area-wide program, the local joint apprenticeship and training committee is responsible for the quality and comprehensiveness of the training the apprentice receives.

Within the framework of minimum national standards recommended for the trade, the local joint committee develops standards governing the training of apprentices at the community level.

In the building, graphic arts, and some other trades where area-wide collective bargaining agreements are in effect, the apprenticeship program is usually established on an area-wide basis, with employers and unions throughout the area participating in the program. An area joint committee has general supervision of the program, including the selection, indenturing, and placement of apprentices. To assure every apprentice of the variety of experience he requires for all-around work in his trade, the committee supervises his transfer from one employer to another. Some of the larger area-wide committees employ full-time apprenticeship and training directors or coordinators to carry out the industry's program. If committees do not have funds to employ directors they delegate responsibility for action to the committee chairman, the secretary, or other committee members.

Apprenticeship Directors and Coordinators

In the large programs, the number of apprentices employed may be too great for an area-wide apprenticeship committee to supervise properly. In instances of this kind, a full-time or part-time apprenticeship director or coordinator is employed by the joint apprenticeship and training committee and works directly under its supervision.

More than 200 local JATC's have employed directors or coordinators to administer their programs. In addition, 40 apprenticeship and training coordinators have been employed by national groups to work with their local affiliates.

Establishing the Committee

The typical local joint apprenticeship committee is comprised of three employer and three union representatives, appointed by their respective organizations for staggered terms of 3 years each. The term of one member of each group expires annually. However, a member may succeed himself.

Selecting Committee Members—What Committee Members Should Know

Committee members appointed by the groups they are to represent should be selected on their qualifications for this important job. Principal qualifications are:

Management Representatives—

Position in the company—Persons in responsible jobs who are in a position to know how apprentices are being trained and able to affect improvements if needed.

Interest in trade and in helping young men learn.

Ability to work with others.

Time available to attend meetings.

Employee Representatives—

Recognized craftsmen.

Interest in trade and in helping young men learn their trade.

Ability to work with others.

Willingness to attend committee meetings.

In general, members should have time available to devote to committee activities; a thorough knowledge of the trade; a genuine interest in working with young people; and broad experience with training practices in their trade.

Understanding of policies, procedures, and authority is necessary to the successful operation of any program. Therefore, JATC members should understand basic apprenticeship and training policies, and their authority and responsibilities relating to apprenticeship.

Although the duties of joint committees may vary in some respects, there are certain major duties that are common to all. These duties are explained in the following pages.

FUNCTIONS OF JATC

Selection of Apprentices

Most area-wide standards of apprenticeship place responsibility for the selection of apprentices on the joint apprenticeship and training committee. In most instances, committees make up a list of qualified applicants and refer the applicants to employers on the basis of an agreed-upon formula, such as referring the best qualified applicant first if he is still interested and immediately available.

Apprenticeship and training committees consider the selection of applicants for apprenticeship a most important factor in assuring the success of a program. In selecting apprentices they consider the applicant's school and work records, hobbies, physical condition, personal traits, acquired skills, aptitudes, educational background, and interests.

Careful selection of applicants for apprenticeship has proved to be of vital importance from the standpoint of the employer, the

apprentice, and the committee. Research studies have shown that it reduces turnover of apprentices, thus cutting down the cost to the employer and saving valuable time of the committee members. Of particular importance is the time that it saves the applicants. If an applicant is not qualified, it is in his own interest to be guided to a more suitable trade or an entirely different occupation.

The informed apprentice will usually be the most cooperative. Many committees find that an explanation of the apprenticeship and training program—its objectives and operation—to applicants for apprenticeship, is extremely helpful. Applicants, as well as apprentices, should be impressed with the opportunity provided by apprenticeship for careers as craftsmen in the skilled trades. They should also be given a frank definition of their duties and responsibilities as apprentices, including hardships and disadvantages of learning a trade. The rules and policies of the committee directly affecting the apprentice should be reduced to writing and a copy furnished the prospective apprentice before employment. A clear understanding of these things will assist prospective apprentices in deciding whether they wish to spend several years in learning a trade through apprenticeship.

Bureau of Apprenticeship and Training and State Apprenticeship Agency representatives are prepared to discuss selection procedures and advise local JATC's on successful selection methods used by other committees. The seven principal steps in a sound selection program are illustrated below.

Joint apprenticeship and training committees can obtain assistance from local offices of State employment services in making the initial screening or the testing of applicants. The employment service has aptitude test batteries which have proved successful in 48 apprenticeable trades.

Training On-the-Job

In view of the fact that the greatest part of the apprentice's training time is spent in actual work experience with and under the supervision of journeymen, the importance of the quality and comprehensiveness of one-the-job training experience cannot be overemphasized.

Members of many committees feel that there is room for a great deal of improvement in supervising apprentices' work experience. It is inadvisable to retain apprentices for excessive periods on one process or operation because they are good at it or because the employer does not want to spend the time and effort to give them training in other phases of the trade. An important part of the job of supervision is to see that apprentices receive a sufficient amount of experience in each of the basic operations and processes in the trade.

There are several steps the joint apprenticeship and training committee may take toward improving the job training of apprentices:

1. *Keep Work Processes Up-to-Date*—Reexamine the work processes as set forth in the apprenticeship standards to determine if all jobs performed by journeymen are listed.

2. *On-the-Job Training Records*—Furnish the apprentice a card, work record log book, or other form listing work processes, so that he can make a record each day of the amount of time he works on one or more of the processes listed. Require the apprentice to turn this record in to the appropriate representative of the joint apprenticeship and training committee periodically at an appointed time.

3. *Check Rotation in Work Processes*—Information from the weekly or monthly apprentice's work record card should be posted in his master record by part-time or full-time clerk employed by the committee. Review the apprentice's work record report at the regular monthly meeting of the committee to determine whether the apprentice is being given an opportunity to learn all phases of the trade.

4. *Tests to Determine Apprentice's On-the-Job Progress*—Apprenticeship and training committees must assume the responsibility of periodically determining the progress being made by the apprentice on the job. These evaluations are excellent devices for keeping the apprentices, journeymen, and employers on their toes.

A fairly simple procedure for handling these examinations is to schedule certain apprentices to appear before the committee at each

meeting for oral examinations. Each apprentice explains to the committee the work he is doing, and has been doing since he started his training or since he last appeared before the committee. Being practical men in the trade, and having the apprentice's work record cards before them, the members of the committee will quickly sense whether the apprentice is making reasonable progress in his work. They will also know whether the apprentice is being given the proper opportunity by his employer for essential experience in all aspects of the craft. By this means committees are able to determine whether and when the apprentice should be transferred to another employer who has the kind of work the apprentice needs to round out his experience.

Apprentice wage increases are not based solely on lapse of time but are a reward for accomplishment. The apprentice should make required progress in learning the trade in each wage period. He should actually work a specified number of hours, and have good reports on his work before advancement is authorized. On-the-job training is a category within itself and should not be averaged with school work for evaluation.

5. *Improving On-the-Job Instruction*—Arrange for job instructor training courses to prepare journeymen for training apprentices on the job.

6. *Placing Apprentices Under Interested Journeymen*—Encourage employers and foremen to place apprentices with journeymen who are willing and able to train them.

Related Instruction for Apprentices

Prerequisite to a quality apprenticeship program is the development of sound related instruction. A minimum of 144 hours a year is recommended, although it is recognized that additional time may be required to keep pace with technological developments.

It is the responsibility of the joint apprenticeship and training committee to make arrangements for related instruction and to require the apprentice to attend class regularly.

Graduated scale of apprentice wages is not just a matter of lapse of time, but rather a reward for the successful accomplishment of a specified percentage of training. The apprentice should be required to have full attendance in related instruction classes with a satisfactory grade average before advancement is authorized. Related instruction is a category within itself and should not be averaged with his on-the-job training for evaluation.

Timing—

There are at least three ingredients in a quality related instruction program. One essential ingredient to successful related instruction is proper timing. This is especially true when utilizing the public vo-

cational education facilities. School officials must plan their courses to meet anticipated needs. Conferences held with them at the earliest possible date will give them the advantage of time to prepare for related instruction needs.

Selecting the Instructor—

A second ingredient to a successful related instruction program is the selection of a qualified instructor. The apprenticeship committee should assume major responsibility, and work closely with school officials in the selection processes.

The importance of selecting a high quality instructor cannot be overemphasized. The best materials, course content, and facilities are of little value if the instructor is not of comparable quality. The ideal attributes and qualifications that should be considered essential in the selection process are:

- knowledge of subject matter (journeyman)
- personality
- general education
- technical competence
- demonstrated interest in working with youth

As a practical matter, it may be impossible to obtain an instructor with all of these qualifications. When this is not possible, greater importance should be attached to technical competence and occupational experience than a high level of general education. In any event, it is necessary to remind the committee that when considering instructor candidates, a review should be made of some of the skills that are needed for quality instruction. Some of these skills are: how to present facts, principles, and theories in an interesting and understandable manner; how to develop and maintain interest of apprentices; how to choose practical problems and how to test or evaluate apprentice comprehension and progress.

To assure itself of having qualified instructors, the committee should encourage craftsmen with the interest and potential to take instructor-training courses. These courses are available in metropolitan areas and in many smaller communities where universities conduct evening extension courses.

Preparation of Course Material—

A third ingredient important to a quality related instruction program is course materials that meet the need of the industry and the apprentices.

The use of prepared lesson material is essential to successful classroom instruction. The committee should not expect the instructor to bear this responsibility on a part-time basis.

In most instances, curriculum materials have been prepared by national joint committees, international unions, vocational-technical schools, or commercial publishers that meet the needs of or can be readily adapted to the particular JATC objectives. When prepared material is not available, the apprenticeship and training committee should be responsible for its preparation. In making decisions on course content, the committee should place a priority on the information to be conveyed to the apprentices. A simple rule to follow in this connection is to determine the importance of the material on the basis of:

1. Essential information.
2. Information that is desirable but not essential.
3. Information that is merely good to know.

There are several commercial publications available that offer practical suggestions in curriculum construction which would be of value to the committee and the instructor. These publications usually present information on determining course content; preparation of outlines and lesson plans; suggestions on presentation; record keeping and other similar considerations that should be taken into account.

Class Attendance of Apprentices—

The four main elements to a successful related instruction program for apprentices are:

1. A constructive and interesting course of instruction directly related to the trade.
2. A competent instructor.
3. Regular attendance at classes by the apprentices.
4. Application by the apprentices to the school work.

If the joint apprenticeship and training committee wants to strive for a quality program, it will have to insist that the related instruction be of sufficiently high quality to justify the apprentices' attendance; and then adopt a policy of compulsory school attendance. Within this policy, it should provide standard rules for absenteeism in bona fide cases of necessity. In the main, joint committees with successful programs find it wise to accept few excuses and to require apprentices to make up all lost time.

Committees should visit related instruction classes periodically to observe apprentice participation, thereby maintaining a constant evaluation of this part of the program.

When directors or coordinators are employed, supervision of classroom instruction and regular reports to the committee are part of their responsibilities. Apprentices who are not making satisfactory progress are brought before the JATC for appropriate action.

Apprenticeship Agreements and Registration

Area-wide apprenticeship programs usually provide that each apprentice sign an apprenticeship agreement with the committee rather than with the individual employer. Some programs provide that the agreement shall be directly with the employer.

The objective of the agreement with the joint apprenticeship and training committee is to provide the degree of flexibility needed to conform with actual employment practices. It also gives the joint apprenticeship and training committee the freedom of action it needs to transfer apprentices from one firm to another and, in the building trades, one construction job to another, so as to assure diversity of work experience and as nearly full employment for each apprentice as possible.

The joint apprenticeship and training committee should enter into a written agreement with the apprentice before he is employed. Some committees prefer to wait until the probationary period has been completed. The agreement or required information on each apprentice is sent to the appropriate apprenticeship agency for registration.

Minute Keeping

Apprenticeship and training committees have found a good set of minutes for each meeting to be a most valuable asset, and as time moves on and policies are determined, the minutes become of great value as a reference. They are also a valuable means of bringing a new member of a committee up to date in connection with the previous actions of the committee.

Important actions of the committee that should be recorded in minutes are:

- Adoption of standards and revisions of standards.
- Apprentice progress action, such as advancement, credit for previous experience.
- Examination records and dates.
- Completion dates.
- Disciplinary actions.
- Reports to employer associations and unions.
- Financial records—monies collected, expenditures.
- Appointment of new committee members.

Understanding the Apprenticeship and Training Program

The success of an apprenticeship and training program depends not only on the activity and interest of the committee, but upon the understanding of all who participate—management, labor, and apprentices.

Many committees have experienced difficulty in getting all of the employers who participate in the apprenticeship and training program and the employer associations in the trade to appreciate fully what it entails; the details of procedure and provisions, such as apprentice wage rates, ratios, requirements for related instruction, and the functions and responsibilities of the apprenticeship and training committee. Some committees have overcome these difficulties by:

1. Publishing the apprenticeship program in pamphlet form, and distributing it to every participating employer.
2. Calling special meetings of the employers and explaining each section of the program.
3. Personal calls by members of the joint apprenticeship and training committee on as many of the employers as possible to explain the program, and to secure their wholehearted support and cooperation.

Obviously, it is just as important to obtain the support and cooperation of the members of the labor union as of employers and employer organizations. Although the employer furnishes the job and the pay, the apprentice is associated with and gets most of his on-the-job training from the journeymen members of the union. As a consequence, successful committees attribute a major part of their success to the fact that they obtain and maintain the wholehearted cooperation and support of the individual members of the union.

Following are some of the steps that have been taken to assure an informed and cooperative union membership:

1. Members of the apprenticeship committee have appeared at one or more meetings of the union to explain the standards agreed upon, to inform the union membership of the functions and duties of the committee, and to answer questions.
2. Copies of the program are made available to union members just as they are made available to individual employers.
3. Special articles on the program have been written for publication in the labor papers.
4. Employers post copies of the standards in a conspicuous place so they are available for reference to the journeymen and apprentices.

Public Recognition of Apprenticeship Completion

One of the high points in the life of a young man is the day he completes his apprenticeship and is recognized by his fellow workers as a full-fledged journeyman. It is also a high point for the members of the committees and the trades.

Many apprenticeship committees are now finding ways to celebrate these apprentice completions. The events range from the presentation of a Certificate of Completion of Apprenticeship to individual apprentices, to a banquet at which all apprentices are honored who have completed their training during the year. In a number of places all of the trades in the community form a joint group and arrange a community celebration.

Public Relations

The apprenticeship program provides a good medium through which employers and employees in the trade can improve the industry's public relations.

The public has only a limited understanding of the great contribution those in charge of an apprenticeship program are making to the welfare of the community.

Many joint apprenticeship and training committees make a special effort to acquaint editors of newspapers, employer, and labor periodicals with their activities. It is easier to complain that editors will not give a program space than it is to inform them of an activity, but the fact is that the editors cannot publish articles on JATC activities unless they are fully informed. If editors are given the news, especially with regard to nonprofit activities about young people in the community, such as apprenticeship, they usually are glad to publish it.

Members of the joint apprenticeship and training committee, as a group, should schedule a meeting with representatives of local papers, TV and radio stations and other public communication media to advise them what is being done to maintain and build up the skills of the craftsmen whose work is of such great importance to the citizens of the community. The probabilities are that these communication representatives will be pleased to learn at first hand of what is being done, and that the conference will be mutually beneficial to them and to the committee.

Many committees have arranged for TV, radio and newspaper coverage of completion ceremonies, apprentice contests, field visits of apprentices and other activities of interest to the public.

Technical Assistance Available

In all matters relating to the employment and training of apprentices, apprenticeship committees may have, upon request, the assistance of members of the field staff of the Bureau of Apprenticeship and Training and State apprenticeship agencies. These field representatives are well acquainted with the best practices and training techniques in the trades. They have current material on the subject

available for the guidance of employers and labor organizations. Their services will be gladly given, without charge, to anyone who wishes information or assistance. Lists of State apprenticeship agencies and regional offices of the Bureau of Apprenticeship and Training are on pages 16–18.

Preapprenticeship, Prejob, or Preemployment Training

Some local joint apprenticeship and training committees have established preapprenticeship programs. Preapprenticeship programs must be carefully planned and efficiently operated, however, if the future apprentice and his employer are to receive maximum benefits from such training. Because of unfamiliarity with the trade, the new apprentice in his early stages of employment sometimes finds his efforts diverted to secondary duties from which the employer realizes little productive value, and the apprentice receives little training. To avoid this situation, it has been found expedient, where this type of training is feasible and practicable, to give prospective or newly indentured apprentices short concentrated prejob training before entering regular apprenticeships.

The preapprenticeship course, authorized and supervised by the local joint apprenticeship and training committee, exposes the participant to designated basic knowledge of the craft. When he enters his apprenticeship, he does so with a knowledge of the basic principles of his trade, and a measure of productive ability and worth to his employer.

The focal point of preapprenticeship programs is the committee and the vocational school authorities. The schools can provide the necessary facilities and equipment. They are also helpful in selecting instructors who are not only skilled at the trade, but who are capable of teaching.

Preapprenticeship programs also serve as a good selection tool to assist the committee in determining the prospective apprentice interest, aptitude, and ability to learn the trade.

Advanced Training for Journeymen

In addition to training apprentices, joint apprenticeship and training committees must develop training programs for journeymen already employed in the industry. Some journeymen did not complete a formal apprenticeship and may need additional training to round out their skills. Technological changes also make it necessary to develop advanced training for journeymen to help them keep abreast of new methods and new materials. Training sponsored by various joint apprenticeship and training committees covers a wide range of subjects. Some of the programs provided to journeymen are:

Auto Mechanic—
- Fuel and Electrical
- Engine Tune-up

Bricklayers—
- Welding
- Transit Operation and Use
- Supervisory Training
- Estimating and Layout

Carpenters—
- Welding
- Estimating
- Use of Steel Square
- Supervisory Training
- Transit Operation and Use
- Metal Forms

Compositors—
- Paste Make-up
- Camera, Developing
- Fotosetter Mark-up
- Imposition, Plate Making

Electricians and Linemen—
- Electronics: Basic and Advanced
- Cable Splicing
- Life Saving
- Automatic Controls
- Industrial Atomic Energy Uses, Hazards and Controls
- Automatic Controls
- National Electrical Code
- Estimating and Layout
- Blue Print Reading and Supervisory Training

Iron Workers—
- Welding
- Safety
- Rigging

Machinist—
- Understanding the Operation of Automatic Machine Controls

Plumbers and Pipefitters—
- Welding
- Lead Wiping
- Estimating
- Refrigeration
- Glass and Plastic Welding
- Nuclear Power Plant Operations
- Pneumatic Controls and Instrumentation

Sheet Metal Workers—
- Welding
- Pattern
- Layout and Estimating

How To Develop Advanced Training for Journeymen

Joint committees may obtain ideas and suggestions for specific training needs of journeymen from employers, foremen, union representatives, architects, engineers, manufacturers, BAT representatives, and equipment salesmen.

Discussion of journeyman training needs at local unions, employer associations meetings and JATC meetings will indicate specific needs. Training may be conducted in employer or union facilities, vocational schools, manufacturers or suppliers plants, and in technical schools, colleges or universities.

Bureau of Apprenticeship and Training representatives and vocational school directors are available to assist communities to develop plans and stimulate journeymen attendance.

One international union has prepared a comprehensive skill improvement course for its journeymen. This course includes training manuals, instructor manuals, visual and training aids.

With the financial means provided through apprenticeship and training funds, many JATC's have constructed and equipped facilities, employed instructors, and provided journeyman training on a continuing basis.

Apprenticeship and Training Funds

At first, area-wide apprenticeship and training programs were financed by informal arrangements for contributions from either employers or a labor organization, or from both groups. In recent years, informal financing plans have been followed by trust funds established through collective bargaining.

These trust funds provide financing in two ways: either by joint payments from employers and the union, or by employer contributions alone. The amount collected is usually based on number of hours worked by journeymen and apprentices, and varies from ½ cent to 4 cents an hour or more. These funds may be legally established (Section 105 of the Labor-Management Relations Act 1947, as amended by section 505 of the Labor-Management Reporting Act of 1959—see appendix for more information). The funds are tax exempt.

Apprenticeship and training funds may be used to provide for:

1. Employment of apprenticeship and training directors.
2. Employment of or supplementing pay of related class instructors.
3. Purchase of books, supplies and other materials.
4. Rental or erection of classroom facilities.
5. Payment of apprentices' wages for class attendance.
6. Completion ceremonies.
7. Apprentice contests.
8. Attendance of apprenticeship director, JATC member and apprentices at apprenticeship conferences.

Several national employer and labor organizations have developed suggested agreement forms for use of local groups in developing trust funds. Some groups that have developed trust fund agreements are The Associated General Contractors of America, Inc.; the United Association of Journeymen and Apprentices of the Plumbing and Pipe Fitting Industry of the United States and Canada; the National Sheet Metal Workers JAC; the National Joint Bricklaying Apprenticeship Committee, and the National Joint Electrical Apprenticeship and Training Committee.

Apprenticeship Contests

Many national and local JATC's have developed apprenticeship contests to help increase apprentices' interest in learning the trade and to stimulate increased interest of journeymen, employers, and unions in developing better craftsmen.

These contests also help develop more public interest in apprenticeship and provide a means to demonstrate good craftsmanship to the public.

Annual National, State, or regional contests have been established in the following trades: bricklayers, carpenters, plumbers, pipefitters, sprinkler fitters, painters, sheet metal workers, molders, core-makers, and patternmakers.

Local, State, and National prizes and awards given to outstanding apprentices stimulates greater interest in the trade and provides additional incentives for them to become craftsmen. Information about these contests may be obtained from the local representative of the Bureau of Apprenticeship and Training.

Appendix D

Legal Status of Financing Plans for Apprenticeship and Training

QUESTIONS AND ANSWERS

The following questions and answers were prepared in consultation with the U.S. Department of Labor Solicitor's Office

1. *What type of apprenticeship or training programs are affected by this law?*
   Only those apprenticeship or other training programs established by representative of an employer's employees and which the employer wishes to finance in whole or in part through the payment of money or other thing of value.
2. *Are such apprenticeship or training program financing plans legal?*
   Yes, if set up in accordance with the requirements of Section 302 of the Labor Management Relations Act, 1947, as amended by section 505 of the Labor Management Reporting and Disclosure Act of 1959. Section 505 added a new paragraph (6) to subsection (a) of section 302 which so provides. The requirements are set forth in paragraph (5) (B) of subsection (c) of section 302. These requirements are stated under question 3.
3. *What are the specific requirements such employer-financed programs must meet under section 302?*
   (a) The employer payments must be made to a trust fund.
   (b) The trust fund must be established for the purpose of defraying the costs of apprenticeship or other training programs.
   (c) The detailed basis on which such payments are to be made is specified in a written agreement with the employer.
   (d) The employees and employers are equally represented in the administration of the fund, together with:
      (1) Such neutrals as the representatives of the employers and employees may agree upon; *or*
      (2) In the event the employer and employee groups deadlock on the administration of the fund, and there are no neutral persons empowered to break such a deadlock, such agreement provides that the two groups shall agree on an impartial umpire; *or*
      (3) In the event of their failure to agree within a reasonable length of time, an impartial umpire to decide such dispute shall, on petition of either group, be appointed by the U.S. District Court for the district where the trust fund has its principal office.
   (e) The trust agreement shall contain provisions for the annual audit of the trust fund, a statement of the results of which shall be available for inspection by interested persons at the principal office of the trust fund and at such other places as may be designated in such agreement.
4. *Should a joint apprenticeship committee have a lawyer prepare its apprenticeship and training trust fund?*
   The act does not expressly require it, but the trust documents are legal documents and it is recommended that a lawyer be utilized. The performance of legal services by persons not authorized to practice law is prohibited in most States.

5. *How does the bargaining agreement relate to the apprenticeship and training trust fund?*

The bargaining agreement is the legal contract between the employers and the labor union. The joint apprenticeship committee derives its authority from the bargaining agreement. Any method for the raising of apprenticeship and training funds, unless strictly voluntary contributions, should be covered in the applicable collective bargaining agreement and the details as to the payments should be spelled out therein. The agreement would be supplemented by a trust agreement.

6. *Should the trust agreement be written into the bargaining agreement or into the apprenticeship program?*

It need not be written into either. However, the bargaining agreement should provide for the setting up of the trust and it can authorize the members of the joint apprenticeship committee to develop the trust instrument, sign it, and function as trustees.

7. *May employers make contributions to materials, money, or other things of value to an apprenticeship or other training program operated by a joint apprenticeship committee if no trust fund is set up?*

Section 302 forbids an employer to make any payments of money or other thing of value to a representative of his employees except in the manner specified in that section, i.e., to a trust fund established as required.

8. *Can other objectives be included in the apprenticeship or other training trust fund, such as industry promotion plans?*

The trust fund should be limited to the purposes authorized by the exceptions in section 302(c). Industrial promotion plans are not among the exceptions.

9. *Can there be separate trust funds for apprenticeship or other training programs?*

Yes. A trust fund can be set up to cover only apprenticeship or a trust fund can be set up to cover apprenticeship and other training or it can be set up for such other training as desired.

10. *Can the members of a joint apprenticeship committee serve as the trustees of any trust fund referred to in the answer to question 6?*

Yes, so long as the requirements of section 302(c) are satisfied.

11. *What does the requirement of equal representation of employers and employees in the administration of the trust fund mean?*

To be certain that the requirement of equal representation is met, there should be equality in the number of employer and employee representatives and equality in their powers under the trust agreement.

12. *Is there a requirement for a neutral person in the administration of the apprenticeship or other training trust fund?*

Either one or more neutral persons agreed upon by the employee-employer representatives or provision in the agreement for an impartial umpire as a tie-breaker. In event there is failure to agree on a problem and there is no tie-breaker, either party may petition the district court of the United States for the district where the trust fund has its principal office for appointment of an impartial umpire to decide the matter. (See questions 2 and 3.)

13. *Is an annual audit of these trust funds required?*

Yes, an annual audit is required. A statement of the results of such audit must be available at the principal office for inspection by interested persons.

14. *May the apprenticeship and training trust fund provide for the payment of salaries, materials, text books, and similar cost items?*

Yes. Joint committees in setting up a trust fund should decide and write into the trust instrument those things relating to apprenticeship or other training for which the funds may be used. Section 302(c)(6) provides that the funds may be used for "*defraying costs of*" these programs.

15. *May a labor representative trustee be fully or partially responsible for the funds of the trust?*

Yes.

16. *Can a union contribute money or other thing of value to an apprenticeship and training trust fund?*

Yes. It can do so voluntarily or it can be stipulated in the bargaining agreement as an obligation that the union will pay "X" amount into the fund.

17. *Are employers required to make reports to the Secretary of Labor on contributions to apprenticeship or other training trust funds?*

No. Section 203(c) of the Labor-Management Reporting and Disclosure Act of 1959 specifically excuses employers from reporting payments to unions under section 302(c) of the Labor Management Relations Act of 1947.

18. *Must those trustees having responsibility for receiving, handling, or distributing funds of the apprenticeship or other training trust be bonded?*

Solicitor's Office Comment: Interpretations of the bonding provisions of section 502 of the Labor-Management Reporting Disclosure Act are being held in abeyance pending currently scheduled meetings with interested parties outside the Government. Any answer to this question is therefore postponed.

Bureau Comment: Regardless of the legal interpretation which may be made, the Bureau recommends that any person be bonded who has the responsibility posed in the question for amounts in excess of $5,000.

NOTE: The Solicitor's Office points out that section 302 is a criminal statute enforceable in criminal prosecutions only by the U.S. Department of Justice and not by the Department of Labor.

CLUES TO SUCCESSFUL ADULT TEACHING

The success of our program is dependent on good teaching. Part of this is determined by the approach and attitude you take toward your students and whether you can give these adults the satisfying results they desire.

Therefore these suggestions, tips, and aids are to help you better understand your students' desires and reasons for taking your class. We also include some teaching techniques and explanations of your relationship to the administration of the program.

An added word for those who are not professional teachers: Some of our most successful instruction has been accomplished by individuals who had no formal training as teachers. These successful "non-professional" teachers had these traits in common:

Each knew his subject matter thoroughly.

Each had a personal interest in the individual's progress in his class.

Most important, they all liked people.

A FEW HELPFUL HINTS

ABOUT ADULTS • • •

- A "satisfied" adult will not only come back, he will bring a friend.
- An adult appreciates systematic, efficient, and capable teaching. From any other kind he may silently steal away. This type of silence can be quite eloquent.
- Adult needs must be met *now*.
- An adult may be impatient because he is a rapid learner.
- Adults respond to failure more quickly than children and in a more positive way—by quitting the class.
- An adult responds more quickly to *praise* and attention.
- The best time for an adult to learn something is when he feels uncomfortable about not knowing.
- The adult likes to be comfortable.
- An adult wants to be treated as a person and a friend, not as a student.
- An adult desires definite work for a definite purpose.

A FEW HELPFUL HINTS

ABOUT THE CLASS • • •

- Adults differ widely in age, previous education, and mental ability, from fellow students.
- They want a variety of activities as well as varied presentations.
- They don't like to waste time.
- They like to add enrichment to the class by calling on their own experiences.
- They like to know what is coming each week.
- They are inclined to attend every class and to be on time.
- They want a break, to stand, stretch, get a drink, or have a smoke.

Each class has its own "personality." The effective teacher adjusts to the needs of the class.

WELL BEGUN IS HALF DONE

The first meeting of the adult class and teacher is the most important one. It will determine the effectiveness of the work done by the group. It often determines whether the group will grow in size or disintegrate and wither away.

For these reasons, well-planned orientation of the adult student is extremely important. When he receives his first impression, it should stimulate an interest in the subject, his teacher, and fellow students. From this interest a successful and satisfying learning experience should result.

SUGGESTED ORIENTATION ACTIVITIES FOR YOUR FIRST MEETING

1. Be in the room ahead of time to greet the first student. Act as host.

2. Be sure the room is ready. Arrange the setting as you want it to help sociability. Adults like to see faces, not backs of heads.

3. Create a warm situation. It is important that class members and teacher get acquainted. Lead off a round of introductions by stating your own name and giving some background information about yourself. Ask the others to follow your example. Or have each student write out the information and exchange it with his neighbor. Introductions may then be made by the "neighbors" who present one another to the group.

4. Get the class underway efficiently with an over-view of the subject matter and specific goals of the course. Give the students an opportunity to discuss ways in which the course can best contribute to their individual needs. Adults like to know where the group is going, how it plans to get there, how long the trip will take. ***If changes are desired by the group,*** make them cheerfully.

5. Emphasize that promptness and continuous attendance is necessary if maximum benefit is to be derived.

6. Explain the type of supplies and equipment to be used and the care and cost of it.

7. Inform students in a positive manner rules or regulations about parking facilities, best entrances, smoking, etc.

8. Explain the required attendance and satisfactory class participation if certificates are given.

GENERAL INFORMATION FOR FIRST CLASS

1. A registered student should have a stub or receipt. If he has none, determine why not or arrange to have him get one.

2. If a textbook is to be used, determine price and method of distribution.

3. Classes always meet unless students are notified. If you are to be absent, let our office know as early as possible.

● ● ● ●

Your students should leave the first session feeling that . . .

- the other students are nice to know.
- the class work will be rewarding.
- the teacher is friendly, helpful and "knows his business."

TO HELP YOU BE A GOOD TEACHER

DO YOU HAVE WHAT IT TAKES?

The teacher of adults must be a good teacher each *session;* his test of competence is a continuing one.

A Good Teacher

- **HAS A GOOD SENSE OF HUMOR**

  He is convinced that learning is the best kind of fun. "When people laugh (or sing) together they cease to be young or old, master or pupils, they become a single group of human beings enjoying its existence." (Highet)

- **GETS TO KNOW HIS STUDENTS QUICKLY**

  "Larn" your class, even if you have to study the names or other data as homework. Adults like to be known individually by name as you do. In case of absence from class, a card or note from you helps. We will supply cards. A friendly chat after a return from absence goes far in building good human relations. A similar chat before or after class, or walking to the parking lot with a student, will return dividends. A successful teacher knows his students and what he teaches.

- **PLANS HIS WORK CAREFULLY**

  A careful plan begins with a course outline based on an analysis of what is to be taught. This "guide," together with unit outlines and teaching aids, compose the course.

  Although the good teacher should be ready to tailor his course to suit his customers, planning each session is a necessity. Planning insures (1) that the teacher knows the goal of the group; (2) which material is to be covered in reaching this goal; (3) which method is best; (4) how the subject should be organized; (5) how provision can be made for both group instruction and for individual attention; (6) and which aids are necessary to make the lesson more effective and interesting.

A plan is a guide, not a straight jacket. A good teacher will hold discussions occasionally on the plan and the teaching methods. These may then be modified if the group needs show this necessity. The class is always right in adult education.

- **GIVES STUDENTS A FEELING OF ACCOMPLISHMENT**

  This is done by organizing the work in short units, by allowing the students "to do" wherever possible, by having frequent summaries or reviews of what has been done, by providing opportunity for questions and using the experience of other students.

- **KNOWS HIS CRAFT OR SUBJECT THOROUGHLY AND CAN IMPART HIS KNOWLEDGE OR SKILL**

  Be prepared to help students with problems in any phase of the work. "Staying one lesson ahead of the class" is impossible in an adult class.

- **USES A VARIETY OF TEACHING METHODS**

  Be expert in devising new and interesting methods and techniques as well as using old and workable ones. Be willing to get away from the four walls of the classroom. Field trips and teaching visual aids are great supplements.

- **CREATES A GROUP CONSCIOUSNESS**

  Adults come together to pursue commonly held interests. Although the class begins as a collection of individuals, commonly held interests provide a means of welding friendships.

- **RIDS HIMSELF OF "SCHOOL TEACHERISH" MANNERISMS**

  Many teachers, over a period of years, develop a classroom air of positiveness and authority. This often creeps in unconsciously and becomes part of the tone of voice, the attitude toward people, the general bearing. An adult teacher is more of a group leader. This leadership cannot be imposed; it must face the more difficult challenge of ***voluntary acceptance*** by the group.

- **RESPECTS THE STUDENT'S TIME**

  Adults expect to get their "time's worth." Begin on time and end on time.

- **REALIZES THAT HE AND HIS CLASS ARE BUT ONE OF SEVERAL TENANTS USING THE CLASSROOM**

  Although the room will be cleaned after you leave, it should be left approximately as you find it. The night school teacher should cooperate with the day staff in intelligent use of the facilities. A meeting might well be arranged with the day-time teacher to discuss mutual problems.

The Good Teacher Is One Who Is Becoming Better

A TEACHING MIRROR

ROUTINE . . .

Do I arrive early enough?
Do I keep a minimum of careful records?
Is my class planned properly?
Is the atmosphere of my room cordial, friendly and suitable for adults?

PERSONALITY . . .

Am I cooperative with my students? My co-workers?
Am I sympathetic and understanding?
Am I mentally alert?
Do I encourage slow pupils?
Do I give praise when deserved?
Do I criticize constructively and in a helpful way?

ATTENDANCE . . .

Am I holding attendance?
Do I follow up absentees?
Do I encourage regular attendance and punctuality?
Do I preview the next assignment properly?

INSTRUCTION . . .

Am I resourceful?
Has my lesson been properly planned?
Have I a variety of teaching techniques?
Is my lesson presented interestingly?
Do I have a definite aim of accomplishment for each evening?
Is the class monopolized by one or two students?
Have I improved my knowledge of my subject?

TEACHING METHODS AND TECHNIQUES

Methods are often confused with techniques. Method in education is the form used to reach a desired goal. Thus lectures, question-answer sessions, group discussions, laboratory demonstrations, use of visual aids and role playing are *methods* of teaching.

Selection of the method for a particular situation is a matter requiring knowledge and judgment. The teacher must understand the learning situation, know the abilities and needs of the students, plan according to the facilities available, and be confident that the knowledge of these factors related to his own abilities and skills will lead the group in the direction of their goals. This, together with ingenuity in devising new methods or new techniques for old methods, is a characteristic of the master teacher.

THE LECTURE

Although one of the oldest types, the lecture is used infrequently today because it is a one-way process, effective only if material is carefully organized, the language of students is used, speech is clear, slow, and not too long, time is allowed for questions, and there are frequent summaries. You must "tell them what you are going to tell them, tell them, and then tell them what you have told them!"

QUESTION AND ANSWER

This is a traditional method of teaching, but it should be abandoned in favor of other methods, all other things being equal. Good questions are designed not to check on whether a lesson is learned, nor to expose factual ignorance, but rather to help the student to learn, to cause him to re-examine his views. Questions should be clear, simple, thought-provoking, attention-holding, developmental.

GROUP DISCUSSION

This is becoming the basic method in adult education. It should be a cooperative enterprise of people "thinking aloud," each open-minded to the ideas of others. Good *show*-how develops good *know*-how.

LABORATORY OR DEMONSTRATION

The presentation should be carefully planned. If possible, students should take part in or, even better, give the demonstration.

Show the simplest and easiest method of doing the job. Explain each new term so that the student can see what is being done and how it is being done.

USE OF VISUAL AIDS

Visual aids are excellent means of imparting information. They save time and make teaching more uniform. They should be previewed and used at the ideal time. In the selection of certain teaching aids there are many factors that influence the specific choice. They should apply to the lesson, meet the time allotment, involve student participation, demand attention, and have technical accuracy.

ROLE PLAYING

An excellent way to learn is through doing. Role playing presents an opportunity to put what has been learned into practice. We can profit by following the suggestions of others and by avoiding their mistakes. This is a means of practicing techniques under the supervision of a trained leader. It gives us a chance to see ourselves as others see us and a chance to correct our errors *before* they become serious.

THIS IS A SHORT WORKABLE OUTLINE

FOR USE IN PLANNING YOUR LESSON

Unit:

Lesson Title:

Lesson Number:

Date:

Time Allotted For Teaching The Lesson:

1. What do I want to accomplish?

2. How will I interest the students?

3. How will I teach this lesson? In which way or ways shall I do this?

4. What helps will I need to teach this lesson?

5. Summary:

Educational Opportunities for Business and Technical Careers in Agriculture and Biology in the North Carolina Comprehensive Community College System, 1967-1968.

North Carolina State Dept. of Community Colleges, Raleigh. Div. of Vocational-Technical Programs
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Sep67 12p.

*AGRICULTURAL EDUCATION; *TECHNICAL EDUCATION; *OFF FARM AGRICULTURAL OCCUPATIONS; *PROGRAM DESCRIPTIONS; CAREER OPPORTUNITIES; EDUCATIONAL OPPORTUNITIES; DIRECTORIES
NORTH CAROLINA

The rapid expansion of the off-farm phase of agriculture has brought increasing need for semi-professional workers. Individuals with a good understanding of agriculture who can exercise sound judgment and competently perform activities of selling, servicing, supervising, controlling, evaluating, diagnosing, building, operating, and testing are in short supply. The associate in applied science degree is awarded to graduates of 2-year curriculums in agriculture and biology from the comprehensive community college system. Curriculums available in the various institutions in North Carolina are (1) Agricultural Business Technology, (2) Agricultural Chemicals Technology, (3) Agricultural Equipment Technology, (4) Agricultural Research Technology, (5) Food Processing Technology, (6) Forest Management Technology, (7) Ornamental Horticulture Technology, (8) Poultry and Livestock Technology, (9) Recreation Grounds Management Technology, (10) Soil and Water Conservation Technology, and (11) Veterinary Medical Technology. Information concerning admissions, prerequisites, length of curriculum, cost, financial assistance, placement, and enrollment is listed. Agricultural curriculums available at each of the 14 institutions and a map of the comprehensive community college system are included. (DM)

EDUCATIONAL OPPORTUNITIES FOR BUSINESS AND TECHNICAL CAREERS IN AGRICULTURE AND BIOLOGY

in the

North Carolina Comprehensive Community College System

1967-68

(Released September, 1967)

INTRODUCTION

American agriculture has advanced more in the past 50 years than in all prior years of our history. Modern farming and ranching--combined with a progressive system of marketing, processing, and merchandising--provide abundant, wholesome food when, where, and how it is wanted; and other farm products with new qualities for home and industry.

Agriculture is an intricately woven web of businesses, including not only those that produce food and fiber, but also organizations that supply and service our farms and the businesses that process, store, handle, and sell farm products. These businesses employ approximately 40 percent of the working force in the United States and over 50 percent in North Carolina.

The technological explosion in agriculture and the rapidly expansion of the off-farm phase of the nation's biggest industry have brought about an increasing need for semiprofessional workers known as "technicians." The agricultural industry needs individuals with a good understanding of agriculture who can exercise sound judgment and competently perform such activities as selling, servicing, supervising, controlling, evaluating, diagnosing, building, operating, and testing in specialized situations.

Examples of areas where agricultural and biological technicians are needed are farm supply and equipment firms, feed and fertilizer plants, horticultural enterprises, poultry hatcheries, agricultural chemicals firms, agricultural research installations, food processing plants, forest services and industries, soil and water conservation districts, animal hospitals and other veterinary medical operations, recreational areas, and large, specialized farming operations.

Two-year curriculums have been developed to meet the needs for technicians in agriculture and biology and are offered in the Comprehensive Community College System. Graduates are awarded the Associate in Applied Science degree (A.A.S.).

VT005741

AGRICULTURAL AND BIOLOGICAL EDUCATION

Associate in Applied Science Degree Curriculums

1967-68

NORTH CAROLINA SYSTEM OF INSTITUTIONS

○ INDICATES 1967-68 LOCATIONS OF TWO-YEAR CURRICULUMS IN AGRICULTURAL AND BIOLOGICAL EDUCATION AWARDING THE DEGREE OF ASSOCIATE IN APPLIED SCIENCE (A.A.S.)

CURRICULUMS AND INSTITUTIONS

Agricultural Business Technology

Purposes. The curriculum in Agricultural Business Technology is designed to help students acquire knowledge, understandings, and abilities in the field of agricultural business, including agricultural production. Objectives of this curriculum are to develop in the student an understanding of the principles of organization and management in agricultural businesses and industries; an understanding of the application of the principles of business management to agricultural production and of the abilities essential to the management of an efficient, well-organized farming operation; an understanding of the basic principles of our economic system, marketing, credit, price concepts, governmental policies, and programs relating to agriculture; and an understanding of the agricultural sciences most essential to the production and marketing of agricultural products.

Careers. A graduate of this curriculum should qualify for various jobs in agricultural business and industry--salesman or store manager in farm supply stores; agricultural field serviceman; salesman, demonstrator, or plant manager of feed and food companies; farm products inspector; and salesman or office manager of farm products marketing firms.

Institutions. This curriculum is offered at the following institutions in 1967-68:

1. Catawba Valley Technical Institute, Hickory
2. Central Carolina Technical Institute, Sanford
3. Davidson County Community College, Lexington
4. Fayetteville Technical Institute, Fayetteville
5. Forsyth Technical Institute, Winston-Salem
6. James Sprunt Institute Unit, Kenansville
7. Lenoir County Community College, Kinston
8. Pitt Technical Institute, Greenville
9. Randolph Technical Institute, Asheboro
10. Surry Community College, Dobson
11. Wilkes Community College, Wilkesboro

Agricultural Chemicals Technology

Purposes. The curriculum in Agricultural Chemicals Technology is designed to prepare the student for entry into the field of agricultural chemicals. This field involves the development, testing, production, sale, and application of pesticides and fertilizers. The curriculum will give the student a functional understanding of the basic agricultural sciences relating to the agricultural chemicals industry; applied chemistry; business organization, procedures, and management of firms producing, marketing, and applying agricultural chemicals; and the formulation and use of farm chemicals and their relation to profitable agricultural production, including safety procedures.

Careers. The agricultural chemicals industry offers employment opportunities for technically educated individuals in sales, research, production and manufacturing, management, and custom farm application of chemicals. Positions are available in the larger companies as well as in the smaller farm supply businesses.

Institutions. This curriculum is offered at the following institution in 1967-68:

Pitt Technical Institute, Greenville

Agricultural Equipment Technology

Purposes. The curriculum in Agricultural Equipment Technology is designed to help the student develop the ability to select, demonstrate, install and maintain internal combustion engines and agricultural equipment. He learns to utilize technical bulletins and manuals relative to the agricultural equipment industry, and he is taught to communicate effectively and to deal with individual human behavior problems peculiar to the agricultural equipment industry. The student gains an understanding of the principles of general business organization, management, and procedures relating to the agricultural equipment industry and selected areas of agricultural economics applicable to the industry. He also gains the ability to utilize the knowledge and skills acquired in solving problems of the agricultural equipment industry.

Careers. Employment is found in areas of manufacturing and distributing equipment. Local distributors or dealers employ technicians for sales, service, and general maintenance of farm equipment.

Institutions. This curriculum is offered at the following institutions in 1967-68:

1. Wilkes Community College, Wilkesboro
2. Wilson County Technical Institute, Wilson

Agricultural Research Technology

Purposes. The curriculum in Agricultural Research Technology is designed to prepare students for entry into the extremely important and rapidly growing field of agricultural research--involving the development, testing, production, and use of pesticides, chemicals, biologicals, plant strains, and animals. Governmental and industrial agencies conduct basic and developmental research on a wide variety of agricultural materials, products, and methods. The scope of activities within the field is practically unlimited.

Careers. Upon graduation from this curriculum, an individual should qualify for positions with State and Federal experiment stations and farms; research centers of pharmaceutical, fertilizer, and chemical companies; large farms; and sales and service organizations. The multiplicity of job opportunities places this program in a unique position for providing positions with futures.

Institutions. This curriculum is offered at the following institution in 1967-68:

Central Carolina Technical Institute, Sanford

Food Processing Technology

Purposes. The curriculum in Food Processing Technology is designed to give students an understanding of the principles, methods, techniques, and skills which are essential for successful employment and advancement in the food processing industry.

Careers. Specific job opportunities in the food processing industries are found in production management, buying, processing management and supervision, quality control, sanitation, grading and inspection, equipment maintenance, sales, and laboratory testing. Some of the employment opportunities in allied industries include sales and service representatives of companies manufacturing equipment and supplies for the food processing industries.

Institutions. This curriculum is offered at the following institution in 1967-68.

Wilkes Community College, Wilkesboro

Forest Management Technology

Purposes. The curriculum in Forest Management Technology is designed to help students acquire technical knowledge, understandings, and abilities essential in developing and conserving our forests and water resources for maximum production and income. Its objectives are to develop student understanding and ability in the principles and practices involved in the production and utilization of forests and the conservation of forest and water resources with emphasis on practical application. In addition, effective ways of communicating and dealing with individual human behavior in working with the public is stressed.

Careers. Graduates should be qualified for entry into positions as forest technicians with Federal and State forestry agencies and private forest industries. The graduate will have abilities in timber cruising, marking trees, forest surveying, log and tree scaling, procuring forest products, supervising forest cutting operations, locating and maintaining forest roads, forest protecting, operating forestry equipment, preparing records, and performing various related technical activities.

Institutions. This curriculum is offered at the following institutions in 1967-68:

1. Haywood Technical Institute Unit, Clyde
2. Wayne Technical Institute, Goldsboro

Ornamental Horticulture Technology

Purposes. The curriculum in Ornamental Horticulture Technology is designed to help young men and women acquire knowledge, understandings, and skills in the production, use, distribution, and maintenance of ornamental plant materials.

Careers. Among the numerous employment opportunities for which the graduate of this curriculum should qualify are nursery and greenhouse foreman, planting and maintenance supervisor, and golf course and park maintenance supervisor. The graduate should have developed abilities and understandings in the reproduction, planting, cultivation, and maintenance of a variety of ornamental plants that are essential for jobs in the ornamental horticulture industry.

Institutions. This curriculum is offered at the following institutions in 1967-68:

1. Catawba Valley Technical Institute, Hickory
2. Forsyth Technical Institute, Winston-Salem
3. Lenoir County Community College, Kinston

Poultry and Livestock Technology

Purposes. The curriculum in Poultry and Livestock Technology is designed to teach the student about producing, marketing, processing, and distributing livestock and poultry and their products according to the scientific principles essential to efficient and profitable operations. The student learns about the specializations of the livestock and poultry industry, including automation, materials handling, manpower efficiency, production control and schedules, contractual arrangements, and vertical and horizontal integration. He also gains an understanding of practical principles of our economic system. Governmental policies and programs pertaining to agricultural production and marketing are emphasized.

Careers. Occupational opportunities include such jobs as feed salesmen, equipment salesmen, field servicemen, flock or herd managers, feed mill managers, and buyers of poultry and livestock.

Institutions. This curriculum is offered at the following institutions in 1967-68:

1. James Sprunt Institute Unit, Kenansville
2. Wayne Technical Institute, Goldsboro
3. Wilkes Community College, Wilkesboro

Recreational Grounds Management Technology

Purposes. The curriculum in Recreational Grounds Management Technology is designed to provide students the necessary knowledge, understandings, and skills to enable them to manage and maintain developed recreational land areas. The curriculum is composed of courses drawn from the areas of ornamental horticulture, soil and water conservation and forestry--as well as courses in communications and the social sciences.

Careers. Employment for graduates of this program would be found at golf courses and local, State, and National parks and gardens.

Institutions. This curriculum is offered at the following institution in 1967-68:

Wayne Technical Institute, Goldsboro

Soil and Water Conservation Technology

Purposes. The curriculum in Soil and Water Conservation Technology is designed to develop the student's understanding of the principles involved in soil and water conservation as well as an understanding of farm production problems related to soil and water conservation. He is taught how to supply farmers, ranchers, and others with technical assistance in planning, applying, and maintaining measures and structural improvements for soil and water conservation as well as how to communicate effectively and to deal with individual human behavior problems in working with farmers and ranchers.

Careers. Although the curriculum is primarily aimed at preparing soil and water conservation technicians for the Soil Conservation Service (SCS), graduates should be qualified to serve in a technical capacity with the Agricultural Stabilization and Conservation Service (ASCS) and with golf club associations.

Institutions. This curriculum is offered at the following institutions in 1967-68:

1. Davidson County Community College, Lexington
2. Wayne Technical Institute, Goldsboro

Veterinary Medical Technology

Purposes. The curriculum in Veterinary Medical Technology is designed to develop knowledge, understanding, and ability in the principles and procedures of a technical and practical nature involved in operation of an animal hospital; the skills needed in assisting the professional worker with the reception, observation, care, and treatment of animals; the performance of certain laboratory tests involved in animal care and research, under professional guidance and direction; and the effective communication and human relations in the animal science field.

Careers. Graduates of this curriculum will find job opportunities as animal hospital technicians to assist the veterinarian in animal care, inspection, hospital and clinical practice, animal colony, and research work. Although emphasis in the curriculum is placed upon developing proficiency in assisting the practicing veterinarian, the instruction will also prepare the student for job opportunities as public and private research and regulatory laboratory technicians and veterinary supply salesmen.

Institutions. This curriculum is offered at the following institution in 1967-68:

Central Carolina Technical Institute, Sanford

OTHER INFORMATION

Admission Requirements

In order to enroll in any of the curriculums, the applicant must be at least eighteen years of age, a high school graduate (or equivalent), and demonstrate an interest in and aptitude for the particular curriculum.

Prerequisite High School Courses

Satisfactory completion of four units of English, one unit of mathematics (preferably algebra), and two units of science (preferably biology and chemistry) are advised for all curriculums. In addition, vocational agriculture (if it is offered) would be beneficial to the student.

Curriculum Length

All curriculums are six 11-week periods (quarters) in length, or approximately 16 1/2 months. This is usually spread over two years with a 3-months summer vacation during the middle of the course of study. (Some curriculums require summer occupational experiences.) Although a student might be permitted to enroll at the beginning of any 11-week period, the fall quarter (beginning in September) would be the most desirable time. Full-time enrollment is highly recommended; however, the degree may be pursued on a part-time basis.

Costs

The tuition fee for a North Carolina resident is $32 per quarter for a full-time student, or a total of $192 for the entire length of the curriculum. (Non-residents of the State are charged 2 1/2 times this amount.) The cost of books, supplies, and miscellaneous items added to the tuition fee should approximate $350 for the total two-year costs. (This amount does not include meal and travel costs.)

Financial Assistance

All institutions make every effort to encourage students with seriousness of purpose to secure an education. Financial aid is available to full-time students in the form of loans, scholarships, and part-time employment. Insufficient funds need not deter any individual from seeking admission.

Student Housing and Boarding

No institutions provide dormitory facilities for student use. The institutions, however, will assist students who wish to live near the campuses to locate suitable living accommodations. There are vending machines in the student lounges that provide light food service at all times.

Draft Deferment

Students are presently exampt from the Selective Service System draft as long as they are enrolled on a full-time basis and performing satisfactorily in their curriculum.

Veterans

Qualified veterans who are admitted for full-time instruction may be approved upon presentation of the Certificate of Eligibility issued by the Veterans Administration under Public Law 550 or Public Law 89-358. Veterans admitted under these public laws are responsible directly to the institutions for payment of all costs.

Degree

Regardless of the type or name of institution, all curriculums of the same title are designed to be basically identical in content and quality, and all graduates are conferred the degree of Associate in Applied Science (A.A.S.).

Placement Service

The institutions provide placement services for graduates. Prospective employers are kept abreast of the graduates in all curriculums.

How to Enroll

Enrollment applications may be secured from any institution in the System; however, it would be advisable to contact the particular institution interested in attending in order to obtain all desired information.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - 10p.

*DISADVANTAGED GROUPS; *VOCATIONAL REHABILITATION; *VOCATIONAL TRAINING CENTERS; *ADULT VOCATIONAL EDUCATION

The placement of students on jobs commensurate with their vocational training was this project's ultimate objective. The program is described under headings of philosophy, objectives, counseling, testing, placement, and curriculum. Vocational courses are offered in auto mechanics, carpentry, ceramics, crafts, data processing operation, graphic arts, home and family living, licensed practical nursing, mills and drills, nurses aide, power sewing, retail sales, state and federal civil service examination preparation, upholstery and furniture repair, vocational business, welding, and cosmetology. Reasons are given for using achievement ability, and specific purpose tests and an extensive counseling program is described. (DM)

Eugene Bullard . . . . . Counseling Supervisor
Gilbert Hartline . . . . . Vocational Coordinator
Don Kraatz . . . . . Counselor
Al Farmer . . . . . Counselor

PHILOSOPHY

Counseling is an integral phase of any school curriculum; however, it plays an extremely vital role in adult education. It is a systematic process of assisting each individual in realistically evaluating his personal assets and his role in society.

Counseling should be concerned with the total development of the individual. It is an effort to help the individual improve his total life adjustment to society, community, family, school, job, and within self. Counseling is a learning process in which new and better methods of meeting difficulties are learned. The acquisition of skills improving adjustment in one area affects adjustment in all areas. When new insights are acquired which aids in an individuals adjustment to his environment, counseling has been functioning to a certain degree.

The school personnel believes in the dignity and worth of each individual and his right to seek a life style which will be productive to himself and the society in which he lives.

OBJECTIVES

The objectives of the counseling department are manifold. Some of the more important objectives are:

1. To give the student a feeling of security in his adjustment to the new, unfamiliar environment.

2. Develop the desire to strive toward a life of social and economic independence.

3. Develop insight into personal assets and limitations.

4. Develop an understanding of and an appreciation for the purposes and provisions of the training program.

5. Identification of students in need of special services beyond that offered by the training facility.

6. Collection of sufficient data for a thorough evaluation of the school program.

7. Development of a sense of individual respectability, pride of accomplishment and an improved self-image.

8. Development of the most realistic schedule for the occupational and educational improvement of the individual.

9. To conduct a placement program in cooperation with other local and state agencies.

10. Follow up the progress of the students after they leave the training facility.

COUNSELING

Individual and group counseling sessions are held regularly in order to help students develop greater insight into their strengths and limitations; examine their role in society; and develop a realistic plan for vocational, educational, social and economic improvement.

Conferences are often requested by the counselor due to referral by an instructor or other school personnel. The students are also encouraged to request counseling sessions concerning any matter of concern to them.

The services of all community agencies which perform functions related to the needs of the student population are requested.

A psychologist and a rehabilitation counselor from Anna State Hospital, Anna, Ill., come to the school one-half day per week and conduct sessions with students referred to them by the counselors.

A psychologist and a social worker from the Department of Mental Health provide referral services to students with child care or family problems.

Department of Vocational Rehabilitation Counselors make periodic visits to the school and talk with students whom the school counselors feel might qualify for their services.

Every effort is made to give the students a feeling of acceptance and worth. The resources of all interested agencies are utilized in assisting the student achieve economic independence.

TESTING

Tests are essential for measuring student progress as well as evaluating the results of the total school program. Since most tests have been standardized on public school populations, it is difficult to locate tests appropriate for an adult population.

Tests currently being used at the School of Adult and Vocational Education are the following:

A. *Achievement*
1. California Achievement Tests
2. Test of Adult Basic Education—This is a test published by the California Test Bureau for use with adults. If this test proves successful, it will replace the California Achievement Test.

B. *Ability*
1. Revised Beta
2. Army General Classification Test (A.G.C.T.)
3. Wechsler Adult Intelligence Scale (W.A.I.S.)

C. *Tests for Specific Purposes*
1. Purdue Pegboard—manual dexterity
2. S.R.A. Clerical Aptitude
3. Personnel Tests for Industry—verbal and numerical

Test results are used for the following purposes:

1. Locating areas of aptitude, strengths and limitations.
2. Identification of students with areas in need of special emphasis or services.
3. Academic placement.
4. Vocational placement.
5. Enable the teachers to do a better job of providing for individual differences in their classrooms.
6. Indication of curriculum changes to meet student needs.
7. Evaluation of the total school program.
8. Obtain an overall picture of the student population.
9. Identification of students prepared to take examinations for the GED or eighth grade diploma.

PLACEMENT

The ultimate objective of the counseling department is the placement of students on jobs commensurate with their vocational training. Businesses and industries in Southern Illinois, Southeast Missouri and Western Kentucky are contacted concerning present job vacancies and the projected employment outlook for the immediate future. Primary emphasis is placed on contacting occupational areas in which the school is preparing students for direct or related entry into the field.

During the 1966-67 school year, 18 per cent of the students were employed in fields in which they were occupationally trained; 16 per cent were employed in related fields; and 66 per cent were employed in fields other than their vocational training. The 34 per cent of students who had received either direct or related training, is a significant percentage, especially since enrollment records reveal that the school population is primarily composed of hard-core unemployed, undereducated individuals.

Regular communication is carried on between the state employment agencies in the tri-state area and the counseling department. Students who are prepared for entry into the employment field are referred to the local office of the Illinois State Employment Service for testing and screening. The state employment agencies are specifically designed for job placement and possess valuable data about employment trends; therefore they serve as important adjuncts to the placement program.

CURRICULUM

The educational and vocational training which meets the needs of the educationally deficient, disadvantagous adults, poses a multi-sided problem involving organization and coordination. A basic objective is to identify the principles and propositions involved in developing a curriculum that simultaneously teaches vocational communicative skills and job training.

Of considerable significance and consequences has been the shift to provide the older age group (50 and above) with a type of school expericence more valuable to them than a strictly vocational or basic literacy class approach. This phase of the curriculum is identified as "Self Improvement Instruction."

VOCATIONAL COURSES	*DESCRIPTION*
Auto Mechanics	Instruction includes all phases of automotive work and repair. These phases deal with engine, power train, electrical, lubricating and cooling, fuel and suspension systems.
Carpentry	The course is designed to help prepare the student with the skills and related technical information required to successfully enter the building trades.
Ceramics	The student is provided the opportunity to develop a motivation toward the use of his hands as a means of creating both useful and decorative objects of ceramic structure in this course. The student is able to learn the basic fundamentals of how ceramic items are produced. An important factor is that through the using of the hands to create, he also discovers a means of adding beauty to the home.
Crafts	Skills in creating many useful items from leather are taught in this course. The pride of accomplishment achieved from the creating of useful leather articles such as purses, billfolds and belts will provide the student both an enjoyable hobby and skill he may be able to carry over into phases of other kinds of work or vocation.
Data Processing Operator's Program	The introductory course will qualify the student as an operator of the basic conventional punch card equipment. The objective of the instructional program will be to give the student the technical background, knowledge and understanding necessary to utilize electronic data processing equipment to the maximum in any given operation.
Graphic Arts	Training in cold type composition, camera and darkroom procedures, plate processing and film development, plate making, offset press operation, bindery operations, production control and photography is offered. The graduating student should be equipped to function well in the publishing-printing industry.

Home and Family Living	The course is offered to women affording them the opportunity to participate in the following phases of homemaking techniques: personal hygiene; meal planning; food selection; selection of clothing; care, repair and making clothing; home beautification; general household planning; and many other helpful home care ideas. Each phase will aid the student in becoming more proficient in their home.
Licensed Practical Nursing	The Practical Nursing course teaches the principles and practices of nursing. The student is prepared to become a member of the professional nursing team by caring for all phases of illness and aiding in the recovery of patients in hospitals and homes or for clients. Students are eligible to take State Board Examinations to become Licensed Practical Nurses.
Mills and Drills	This course prepares the student to be able to function as an operator of milling machines and drill presses that will be encountered in many phases of manufacturing. During the training period the student will have the opportunity to receive instruction in all six phases in milling operations and will cover approximately 12 phases of drilling operations. Length of the course will be 15 weeks.
Nurse Aide	Instruction is presented in simplified form concerning the theory of nursing principles and teaches the basic skills of nursing on a non-professional level. Prepares the student for duties in homes caring for the ill, aged and shut-in.
Power Sewing	The course teaches the threading operation and control of industrial power sewing machines and with time and practice the student can be employed in the sewing industry. The student will become familiar with light maintenance, parts of the machines, needle setting, folder adjustment and knife setting.
Retail Sales	Instruction is given in the techniques of selling in many of the retail sales operations in the myriad of businesses today. Students learn about the product, stock, displaying the stock (shelves, counters, etc.), inventory, customer relations, cash register operations and change making. The student should be proficient enough in these areas at the end of the course to properly function in the retail sales field.
State and Federal Civil Service Examination Preparation	The course is designed to present the basic fundamentals required to improve performance on state and federal civil service examinations. Methods of study, review on important factors, clarification of various "question structures," and increasing speed and accuracy, will be among the various topics discussed. Pre-tests are given to obtain the functional level of each individual. Instruction is adapted to meet the needs of the student.
Upholstery and Furniture Repair	The course prepares the student to be able to repair, rebuild and upholster and construct the majority of upholstered and semi-covered items of furniture in existence and to function in the trade.

Vocational Business

The business course enables the student to progress at a reasonable rate from beginning typing skills, shorthand and dictation through advanced typing and procedures with business forms and filing.

Welding

The student receives training in all current practices and techniques concerned with both arc, acetylene and tig-arc welding. At the completion of the course the student should be able to function as a competent welder in industry.

NEW VOCATIONAL AREA CURRENTLY BEING IMPLEMENTED

Cosmotology

Cosmotology or beauty culture, also called cosmetic therapy and cosmetic art, is the science of the care and adornment of the body. The course, as offered by the school, meets the State of Illinois standards in total hours, staff, equipment, facilities, reference material and curriculum. A one year program will be offered which will meet the requirements of 1500 hours training. The curriculum shall include: shampooing, facials, electrical devices, scalp and hair conditioning, hair and hair coloring, permanent waving, hair dressing, sanitation and sterilization, personal hygiene, first aid and duties of dispensary clerk. Also included in the curriculum will be courses dealing with the fundamentals of English, salesmanship, bookkeeping for a shop, speech and psychology. Upon successful completion of the program the student may present his certificate of work at the school to the Department of Registration and Education in Springfield, Ill., to be eligible then to be examined for a license as a licensed cosmetologist.

SELF IMPROVEMENT INSTRUCTION

Basic literacy skills are provided for adults who function at the primary level on a full day basis. Though it is inevitable that certain similarities will exist between the adult program and the traditional public school system, these similarities are minimized as much as possible.

The instructional program is designed for adults who are unable to participate successfully in the occupational world because of a deficiency of essential skills. It provides the core areas of basic education: reading, writing, mathematical and language skills; plus an understanding and appreciation of our nation's historical development, the contributions of various individuals and minority groups, governmental structure and the nations position in the world today.

Because of the need to maintain optimum motivation, a diversified schedule of learning activities is planned. Instruction in leather craft and ceramics is interspersed in each basic education student's schedule to break the academic routine.

More specifically, the objectives of the self improvement program are:

1. To develop an understanding of the system and organization of written language.
2. To read for both enjoyment and information.
3. To understand the underlying principles of basic arithmetic processes–addition, substraction, multiplication and division–and their application to practical situations.
4. To develop an understanding and appreciation of our American way of life and its foundations.
5. To express an interest in the wholesome use of leisure time.
6. To develop or increase the desire to become a productive, independent citizen.
7. To understand the importance of utilizing educational opportunities.
8. To express a greater awareness and understanding of current events.
9. To develop a desire to learn more about the local community and its problems.
10. To improve skills in interpersonal relationships.
11. To inform themselves about local, state and national issues and to knowledgeable participate in the election of officials at all three levels.

In order to prepare young adults from areas of high unemployment in Detroit for successful competition in a changing labor market, employment project objectives were: (1) to counsel, test, and provide complete medical and dental examinations for incoming trainees, (2) to provide special job training opportunities that could be utilized by the trainees to acquire work training and hold jobs, (3) to provide related educational programs, 94) to develop new methods of testing and counseling to more accurately evaluate potentials, (5) to provide programs of selection that match youth with job opportunities and increase motivation, and (6) to provide a follow-up program for the trainees once they have been terminated. Trainees were unemployed youth 16 to 21 years of age, from socioeconomically deprived families in Detroit. Statistics revealed that during the period involved, 520 individuals were in regular enrollment. Of these, 96 were terminated, 408 were involved in employment placement, and 459 were enrolled in additional special activities such as Neighborhood Youth Corps. Barriers to jobs were listed as age, medical problems, high school diploma, criminal record, and ethnicity. The major effect of placement was orientation to reality and effective use of training. Recommendations included introducing more employers to the project and introducing clients to employers. (DM)

ACKNOWLEDGEMENTS

The success of the Mayor's Youth Employment Project has, over the past fourteen months, been attributed to a number of factors and more importantly, individuals.

The Honorable Jerome P. Cavanagh, Mayor of the City of Detroit, has been an ardent supporter of the Project. The Mayor had a long record of innovating and implementing special projects to assist the people of the City of Detroit.

Mr. Richard Strichartz has exhibited a strong friendship for the Project not only as Special Assistant to the Mayor, but as City Controller and as an active member of the Technical Advisory Committee.

The Technical Advisory Committee, under the chairmanship of Mrs. Mildred Jeffrey, is composed of the leadership of the complete community. Representatives of government, labor, industry, business, and education make up this respected, working committee. As a Technical Advisory Committee, it has worked hard and long to assist in solving the problems that have confronted the Project and the trainees.

Other agencies through their individual representatives have made major contributions to the Project.

Dr. Samuel M. Brownell, Superintendent of the Detroit Public Schools, has lent MYEP the support of his office and staff even during the most crucial periods of the Detroit Public Schools.

Mr. Malcolm Lovell, Director of the Michigan Employment Securities Commission, has been responsible for the many assistances given MYEP through his staff and facilities.

Every sector of the City of Detroit has made contributions. Labor, management, private and public institutions, individuals, service clubs, and churches have donated their time, money, facilities, and name to this enterprise.

Table of Organization #3 MYEP, April, 1965	44

I. PROJECT PURPOSE

A. NEED

In September, 1964, the Michigan Employment Security Commission reported that only 2.8 percent of the local labor force was unemployed. During the same month, Arthur Greenleigh Associates, of New York City, conducted a study of the inner city to identify the characteristics and needs of the poor.*

Of the more than 2,000 low-income families interviewed:

87.8 percent had incomes inadequate to maintain minimum living standards.

55.8 percent were headed by an adult who had an eighth grade education, or less.

49.2 percent had one or more children with a school learning problem.

41.0 percent lived in unsafe or unsanitary housing.

43.1 percent needed health services for adults.

19.9 percent needed health services for children.

The hypothesis that these handicaps often combine to condemn the poor, and their children, to chronic underemployment or unemployment is confirmed by the following data, collected from the same survey group:

29.6 percent of the households had one or more

29.1 percent of those 18 to 21 years of age were unemployed and out of school.

*Greenleigh Associates (New York & Chicago), A Study of Services to Deal with Poverty in Detroit, Michigan - (March, 1965).

54.1 percent of heads of households were in the lowest paying occupations of unskilled workers, laborers or service, clerical and sales workers.

17.4 percent of heads of households who were employed had incomes of less than $3,000 per year.

40.2 percent of all households required vocational training and counseling services.

These findings underline the need for programs designed to increase the access of the poor, and especially the near-adult children of the poor, to adequately remunerated, full-time employment. The need for such programs is not equally distributed throughout Detroit, however. Within the target areas selected for concentrated community action, for instance, there are twice as many families with annual incomes of less than $3,000 and three times as many on public assistance as in the rest of Detroit, according to the 1960 U.S. Census of Population. Obviously the prosperity which most Detroit residents enjoy has failed to have any meaningful impact on families living in the target areas.

Critical to the success of MYEP's preventive efforts is the effective operation of a project which offers young adults from low-income families a controlled introduction to the world of work. The health and educational problems presented by these young men and women are complicated, however, by the operation of several factors:

1. A one-industry metropolitan complex subjected rapid technological change resulting in higher entry level working skills.

2. A heavy influx of unskilled labor from the southern states during World War II and the economic boom that followed.

3. Declining city tax revenues.

4. A deteriorating inner-city school system.

5. Extensive inner-city urban renewal.

6. Inadequate public health facilities.

These problems affect all employment levels but most crucially the youngsters from the unskilled labor group. The social economic price of poverty is not levied indiscriminately nor on racial lines, but where inadequacies are most frequently found in the lower scale of this group and most harshly among non-whites.

In any consideration of an unskilled labor group within the framework of American structured society, work and marriage are considered the two major determinants of individual behavior and group attitudes. In a very real sense, through these two social commitments, all groups surrender hostages to society as a guarantee of conformity to socially acceptable behavioral norms. One of the few exceptions to this behavior is that of the young non-white male.

In order to understand the behavior of this sub-group, it is necessary to have a working knowledge of the familial group in its entirety. Studies of this group have shown the family to be what anthropologists describe as matrifocal, or centered around the mother rather than the father. The mother is the head of the household and the basic family group includes her children, and perhaps one or more of her female relations.

Often, almost to the point of consistency, the adult man is a marginal and only intermittent participant in the female-based and dominant household.

Other studies have revealed the presence of serial monogamy, a pattern in which a woman lives and has children by a series of men who desert her or whom she asks to leave. The man who has difficulty in finding a steady job or is laid off frequently, finds it difficult to function as the male breadwinner and household head. Moreover, when the woman is able to find steady employment or can subsist on welfare payments, she tends to treat the man with disdain and quite frequently open hostility. Under these conditions there is no motive for the man to remain in the family, and in times of stress, he frequently deserts. Moreover, when the male children develop and grow to maturity in a predominately female household--where the man is often a powerless and scorned figure--their upbringing encourages ambivalence as to their male functions. In this manner, the pattern of the irresponsible, socially uncommitted, hostage-free male, is transmitted to the next generation.

This abdication of household responsibility, either through desertion or breakdown, is not typical of other minority groups within the disadvantaged sub-culture. As a rule, women in these families are active in supporting by word and deed the authority of the male, and in urging the child to act in ways defined as male by their culture.

The family structure is an influential factor in contributing to the inability of these youth to accept any routine imposed upon them by work-oriented adult society. And for this reason the most important adult routine, that of school, is confusing to many. Emerging from homes in which learning, reading and communication have not been encouraged, their attention span is very short. This makes studying and learning difficult. Moreover, the school, a middle-income institution, seeks to train them for a way of life that is in many ways diametrically opposed to the one they so far experienced.

Some of the dimensions of the task confronting Detroit's Program can be inferred from the disparities in occupational and income status recorded in official Census data. 69 percent of the residents of the target areas selected for concentrated community action efforts is non-white, but only 29% of the entire population in the City of Detroit is non-white. The significant differences in occupational status reported in 1960, are summarized in the table below.

	Percent in Each Group			
	Males		Females	
	White	Non-White	White	Non-White
High-skill occupations	48	19	14	12
Medium-skill occupations	42	50	64	52
Low-skill occupations	10	31	22	36
	100	100	100	100

The low occupational status of non-whites translates directly into low income status. But the disparities in income status are made even greater by the inability of non-whites to secure as much

work as whites within the higher paying occupational categories.

The table which follows presents data for the entire labor force, not just those employed when the census was taken. While 62 percent of the white males were fully employed during the census year, only 44 percent of the non-white males were. Differentials of this order appear for each separate major occupational group. Significantly, the difference was least in the low-paid jobs.

If non-whites are removed from the "All" group shown in the table, the median income for all white males is seen to have been about 38 percent above the median for non-white males.

To a large extent the discriminatory practices which work to the detriment of non-whites as they strive to enter the job market are on the wane in Detroit. Considerable work must still be done to inform both employers and prospective employees of the exact nature of their rights and responsibilities under legislation such as local fair employment.

U.S. Census of Population, 1960; PC (1) 24D, pp. 541 - 544

The pressing need in Detroit, however, is to prepare target area young adults for successful competition in the changing labor market--prepare them to take advantage of the increasing opportunities available to non-whites. Detroit's Program must be able to draw on resources flexible enough to tailor work-experience, pre-apprenticeship training and skills training programs to specific, individual and group needs.

B. OBJECTIVES

1. To counsel, test, and provide complete medical and dental examinations for incoming trainees and to determine a plan of attack for each trainee on an individual basis.

2. To provide special job training opportunities that can be utilized by the trainees to acquire work training and specific skills necessary to hold jobs in government, private business and industry.

3. To provide related educational programs designed to complement on-the-job and vestibule training with remediation in basic reading, verbal, and arithmetic skills.

4. To develop new methods of testing and counseling to evaluate more accurately the potentials of young people from low-income families.

5. To provide programs of selection that match youth with existing job opportunities, new job opportunities, increase individual motivation and improve trainee's work adjustments.

6. To provide a follow-up program for the trainees once they have been terminated. A job clinic, testing, counseling, and guidance are a few of the services which were provided in this area.

C. PROGRAM FORMAT

The Mayor's Youth Employment Project (MYEP) was designed to provide meaningful vestibule and on-the-job training, coupled with related classroom instruction for socially, economically, and educationally handicapped youth. The Project also provided Pre-Apprenticeship, Coupled, and Pre-Entry programs. Many of the trainees were high school graduates who have not been able to make a successful transition from the world of school to the world of work. The training program was in most cases based on a five-day week with four hours of vestibule training, and three hours of related classroom instruction each day. One hour was provided for lunch and travel. Variations in the day's schedule were often necessary because of the variety of types of programs. Youth between the ages of sixteen through twenty-one years of age were eligible.

The Mayor's Youth Employment Project in cooperation and consultation with OMAT, for a period of 12 months, provided a special program for selection, counseling, testing, evaluation, referral to training, placement and follow-up of between 600 and 1,200 youths (depending upon the degree and length of training required). MYEP provided the services described below as well as additional services deemed appropriate and expedient to a changing situation.

Characteristics of Persons to be Served

Trainees were unemployed youth who were at least 16 years of age and not over 21, and who were from socio-economically deprived families in Detroit. Special consideration (but not exclusive) was

given to those youth who live in areas designated as target areas by Detroit's Total Action Against Poverty Program (TAP). In addition, MYEP undertook specially designed E & D programs for "problem" and "special-need" individuals (i.e., probation and parole cases, pre-apprentice and pre-OJT) regardless of age, as deemed advisable.

Program

MYEP operated a program for selection, testing, counseling, and referral to occupational training similar to that established under the contract with OMAT dated June 27, 1965. The following are the constituent parts of this program as it was operated under this grant:

Trainee Recruitment

Recruitment of trainees was performed by both the Michigan Employment Security Commission and MYEP. Recruitment by MYEP permitted exploration of new approaches and avenues to potential-trainee contact whenever considered practical.

Testing

All incoming trainees were given aptitude and interest testing by the Michigan Employment Security Commission. The purpose of these tests--to help guide the trainees into suitable occupational preparation--was explained to the trainees, and they were made aware that they could neither pass nor fail.

MYEP also carried on its own testing programs and orientation sessions regarding tests. The primary purpose of MYEP's testing program was to prepare the trainee for the entrance tests, promotion

tests, and release tests which are a regular part of the world of employment.

Counseling

An intensive program of counseling designed to enable the trainee to reach his potential for vocational accomplishment was provided by the Project staff, supplemented from time to time by personnel of the Employment Service.

The project counseling staff had no authority for administering discipline of any kind and the counseling rooms had all symbols of authority removed. Consequently, student reluctance to visit the counselor, such as exists in some public schools where counselors administer discipline, was minimized.

Training

Several different types of training programs were offered. Individual trainees could move from one training program to another, as seemed appropriate to enable them to obtain and hold a job following the end of the total training program.

The constituent parts of the training program were:

1. Orientation

The orientation period was intended to prepare the trainee for his on-the-job training experience, vocational future and life goals. It involved: (1) planning the steps necessary to reach the trainee's goal, (2) making the trainee aware of employer expectations and planning to meet these, (3) improving the trainee's understanding of inter-personal relationships in work, and (4) helping the trainee

to acquire the understanding and attitudes necessary for successful vocational adjustment. It often included advanced testing, counseling, instruction in personal grooming, job orientation, cultural trips, job posture, talks and meetings with the work-education coordinator. The duration of the orientation sessions varied with the needs of the trainee, but in no case exceeded six weeks.

2. Institutional Training

Trainees were enrolled in institutional training situations provided by the Department of Health, Education and Welfare through designated agencies related to their occupational goals and needs.

3. Vestibule Training

Vestibule training was a type of training program in which trainees did non-productive work in an on-the-job training type situation. Generally, such training was provided as part of an overall program which included three hours a day of remedial, academic or related work at training institutions, but in some instances, the trainees were given full-time vestibule training. Vestibule training was provided at work sites provided by governmental agencies and private non-profit organizations.

4. On-the-Job Training

Trainees placed in on-the-job training were compensated by wages paid by the employer. Arrangements for OJT, where MDTA funds are sought for training expenses, were made in accordance with the requirements of the Bureau of Apprenticeship and Training of the Department of Labor.

5. Coupled program

The coupled program involved a combination of institutional and on-the-job training, depending on the individual needs of the trainees and the services available through the company providing OJT. It could also couple any series of programs to provide a sequence of learning experiences.

6. Pre-entry program

This program was non-institutional and was designed to enable the trainee to meet the entrance requirements of particular public or private agencies which maintained their own training programs, such as apprenticeship programs or special company training programs. The pre-entry program lasted from two to six weeks.

7. Pre-apprenticeship, Pre-training

This program was similar in purpose to the pre-entry program, but it could be longer than six weeks and it could be provided through an institution or MYEP facility. It was designed to bring a trainee's basic education to the level required for entry into apprenticeship or MDTA type training programs. The Technical Advisory Committee formed a sub-committee as a union management team to give direction to this portion of the program. Those unions would be represented whose area of work is part of a particular program.

8. Placement

Three job development and placement specialists were employed by the project to work directly with the trainees and to help them find jobs.

They made use of the services of the Michigan Employment Security Commission, and reported all placements made by the project to the Youth Opportunity Center of MESC. The senior job development and placement specialist cooperated with BAT in establishing OJT and apprenticeship programs.

9. Follow-up

The Contractor, with the aid of the Michigan Employment Security Commission, provided follow-up at periods of three, six, and nine months after placement.

MYEP's training program was conducted so that approximately a half day was devoted to classroom instruction and the other half of the day devoted to job (vestibule) training.

The classroom training was directly related to the job training station on which the trainee was placed. If the trainee studied auto-mechanics, he was given remedial English directly related to auto-mechanics. For example, he was not taught a long list of words which have no meaning in his real work. He was taught remedial English by direct encounter. He might have learned that a sentence reads: "Pistons go up and down." not: "Bees buzz."

In this manner, he immediately saw a tangible reason for studying his subjects. Too often, our regular schools teach things that cannot be readily and immediately related to the real world.

The term "vestibule" is applied to Detroit's rather unique job station training, in the sense of a "passage" or "entrance," since the trainee is not out of nor is he in, a job. He is in training for the entry level, and it is a training experience, not a productive work experience. These training stations were located primarily with the City of Detroit, although it is hoped to eventually include the use of State and Federal facilities. During this phase, an assigned coordinator visited the training stations, talked with the supervisor and the trainee and was generally concerned with needed additional consultant services for the trainees, and checked on possible job placement readiness.

Throughout this period, two additional phases were conducted. The project's orientation and operation was two-fold but integrated. Firstly, it provided the individual trainees with the needed skills to permit them to enter the world of work and, secondly, it assisted them in removing or adapting to any obstacles interfering with their ability to enter or to function in a work situation.

Complete health remedial resources were available to the trainees, and after complete evaluative physical examinations the recommended medical, dental or other referrals were made. Counseling, individual and group, was provided to the degree needed by the trainee with emphasis on self-upgrading of the individual through additional education and training. As broad an exposure to vocational and employment opportunity as is possible was provided since many trainees

come from backgrounds where unemployment or marginal underemployment is normal and their knowledge of the world of work is minimal at best. To know what they would like to do, what they can do, and what is available to do were necessary ingredients to satisfactory placement.

Job referral was a regular part of the learning situation although mock interviews and test situations are effective only up to a given point. Guidance in grooming, conduct and attitudes during interviews, test taking techniques, and other related preparation form other parts of the program.

The Project maintained its own job development and placement personnel. Operating with the philosophy that successful placement is dependent on fitting the job to the person and not the person to the job, they were vital to the effectiveness of the entire program since a part of the Project's philosophy is that a job is the cement that bonds the individual to society.

D. Management and Staffing

This section of the report concerns itself with the staffing of an E & D Project, supported and funded through the Office of Manpower Automation and Training and the U. S. Department of Labor. Funds for the educational phase were provided by the U. S. Department of Health, Education and Welfare through the Detroit Public Schools.

A. HISTORICAL BACKGROUND

The Committee for Community Action for Detroit youth was a blue ribbon task force established by Mayor Jerome P. Cavanagh early in 1963.

Its charge was to survey the needs of the youth of the City of Detroit and make the necessary recommendations so that the ills could be overcome in a vigorous attack.

One of the major outgrowths of CADY was the Special Youth Employment Project.

A proposal was designed and submitted to the U. S. Department of Labor and the U. S. Department of Health, Education and Welfare. The Labor Contract was returned directly to the City of Detroit. The HEW Contract was returned via the State Department of Education, to the Detroit Public Schools. They in turn released or subcontracted their portion to the City of Detroit. The Detroit Public Schools agreed to assist in teacher certifications and employment, physical location and instructional supplies.

Therefore, the City of Detroit found itself with a Special Project, dually funded and without firm guidelines. It was after all an Experimental and Demonstration Project. The proposal spelled out some job specifications for staffing, overall objectives and the criteria of population to be served and a line item budget.

In January, 1964, the Special Youth Employment Project began on an operational status.

The OMAT staff was appointed by the Mayor so that the project could begin immediately. It consisted of the following:

Director
Job Training Supervisor
Test Specialist
Two Counselors
Two Job Development and Placement Specialists
Four Work Education Coordinators (teachers)
Recommended to the Detroit Public Schools and certified by same
Five office staff

After about four months of operation, some difficulties arose as to the efficiency and direction of the project. The U. S. Department of Labor requested a review of the staffing and organization of the project.

A number of OMAT staff resigned their positions and a request went to the Civil Service Commission to select staff for the project.

The Civil Service Commission publicly announced open competitive examinations for said positions, including a new position, that of Assistant Director.

The Directorship was to remain as a Mayor's appointee position.

FORMAL SELECTION

During this beginning period, the Detroit Civil Service Commission drafted a job specification and code identification for each of the above positions, not including the Work Education Coordinators.

By City Charter, all persons with the exceptions of the Mayor's appointees must be processed by the Civil Service Commission. This includes city residency, age, education, written test and oral interview requirements.

91

TABLE OF ORGANIZATION #1

SYEP January, 1964

The written tests for these positions generally included an intelligence test and sections on local, state and Federal government, sociology, psychology, social psychology and public relations.

Then for each specific area, special tests were used to gain data concerning the subject matter related to the job. These were in depth tests.

For example, the Director was required to take the Assistant Director's test sequence. This battery included the general tests listed above, an overview of the specific tests for each of the fields he was directing and a heavy concentration on such areas as, management principles, organization principles, public and business administration, public relations, supervisory practices and personnel concepts.

A total point system is used and from this a position is established on the list of the particular job classification.

As a result of the aforementioned system of examination and evaluation of candidates, lists were compiled for each of the job classifications. All staff members are drawn from the top of the specific job title list at Civil Service. No deviations are permitted with the exception of male or female type.

Of the total staff members involved, only two had to be returned to Civil Service because of unsatisfactory service in this particular project. The majority of staff members who left the project went into an upward mobility pattern. Some returned to their former occupations, such as teachers, housemakers and other similar occupations.

From January 1, 1964, to June 31, 1966, there has been a 97% turnover in staff. Only 4 staff members remain that started with the revamped program May 4, 1964.

C. SELECTION OF DIRECTOR

The two top candidates for the position of Assistant Director were interviewed by the Mayor and his staff individually. The Director was appointed to serve at the Mayor's pleasure. The other candidate was made the Assistant Director under the Civil Service system. The Assistant Director, with a PH. D. in Psychology had tremendous technical knowledge and added more than a full measure to the project.

Upon assuming the duties of the Directorship, he reviewed all past memos, rules, procedures, policies and table of organization. Since the above mentioned communications apparently did not delegate authority, a new table of organization was developed, and with it, policy, rules and procedures to supplement the plans leading to the objectives. See Chart #2.

A "team" concept of direction was developed using the entire OMAT staff with their specific disciplines. Following the trend, apparently established by business, the "management team" was utilized immediately. Although the final decision was ultimately made by the Director, it was the team that supplied the necessary data that enabled the correct decision to be made.

Later, during the second year's operation, the executive team was comprised of the Assistant Director and the senior level personnel.

TABLE OF ORGANIZATION - CHART #2

SYEP MAY 31, 1964

The small size of the E & D Project enabled the entire OMAT and educational staff to have to face meetings at any given time. The entire staff knew the total story of the project in terms of the past, present and the future projections. They knew the questions and the answers given.

The loyalty and traditions absorbed by the staff are closely related to the philosophies established by the Director with the aid of the Technical Advisory Committee. Even during the most trying times, (interim prior to refunding, newspaper and TV editorials) the staff performed at a high degree of efficiency and individual warmth.

D. FACILITIES

An office and classroom building was made available through the generous contribution of Mr. Abraham Shiffman at 1501 E. Ferry.

The Detroit Public Schools leased a surplus school for the project (HEW funds) and it was located at Joseph Campau and E. Forest.

The City of Detroit provided well over 200 vestibule training stations through its various departments. The Water Board, DPW Garages, Fire Department Garages, Engineering, Hospitals, Controller, DSR and the Library are but a few of the cooperating departments.

In providing these training stations they automatically committed personnel to work with the trainee in a one to one relationship.

As a result, the main instructional phase was accomplished at the Campau School; the administration and Special Projects phases were handled at the Shiffman Building and the work experience Vestibule Training at the City departments.

Because of the diversity of physical locations, the job training supervisor was delegated the authority of a "Principal" and the Campau School was brought under his control. The necessary supportive staff was assigned to the school.

E. TECHNICAL ADVISORY COMMITTEE

The Mayor appointed a Technical Advisory Committee. This working committee cut across the business, industry, education, labor and government segments of the community.

Along with their duties as advisory/consultants to MYEP, several standing sub-committees were used continuously. They were the Personnel Sub-Committee, the Health Sub-Committee and the Finance Sub-Committee.

F. WORK EDUCATION COORDINATORS vs TEACHERS

A request was made to the Detroit Public Schools to request funds from the Department of Health, Education and Welfare for the continuation of the institutional phase. This request was made about October, 1964.

By the time the request was received at HEW, it was noted that they had committed all of their funds for the coming year. This left the Mayor's Youth Employment Project in a peculiar position. The Labor Department had issued the necessary contract for another years operation, but it appeared that there would not be any funds for the institutional phase.

The Detroit Public Schools agreed to support MYEP in this area to the best of their ability. The necessary funds were withdrawn

from other uses and allocated to the servicing of MYEP.

Of necessity, this use of restricted funds caused a cutback in the number of WEC's to be employed by the Detroit Public Schools. From a maximum of 14, the cutback brought the number to 4 people. As a result, it was necessary to require these people to teach full time rather than teach ½ day and coordinate the other ½ day.

The 1965 Labor Contract provided for four coordinators. These were assigned to the job of coordinating the vestibule work stations with the related instruction.

The Work Education Coordinators were in fact employees of the Detroit Public Schools, assigned to and under the direct supervision of MYEP for the first contract.

During the second year, the teachers (4) were assigned to MYEP but under the supervision of a "Team Leader" of the Detroit Public Schools. Coordination was achieved to some degree between the two similar supervisors of each agency.

G. WORK EDUCATION COORDINATOR/TEACHER SELECTION

The personnel assigned to MYEP by the Detroit Public Schools were generally selected or recommended by the administration of MYEP to the Personnel Sub-Committee of TAC. Following this interview and review of personal background, the Sub-Committee would recommend those deemed acceptable to the Detroit Public Schools Personnel Committee.

They in turn would accept or reject based upon the requirements of the job and the technical and performance background of the

individual. The applications of those accepted were then forwarded to the State Department of Education for Emergency Vocational Certificates where needed.

The Detroit Public Schools were most cooperative in this area of WEC's and/or teachers. They permitted some of their regular teachers to obtain a leave of absence to assist MYEP with the institutional and administrative phases.

H. SALARY SCHEDULE/INSTITUTIONAL STAFF

As noted above during the first contract year the WEC's were paid a flat rate of $5.48 per hour.

During the second years' program they were paid at a rate commensurate with the teachers at the Detroit Public Schools Skills Center. This ranged between $4.00 per hour for a teacher of a non vocational subject to $4.50 for a "Team Leader", to $5.48 for a teacher of vocational subjects.

I. SALARY SCHEDULE/OMAT STAFF

The administrative staff, as funded by OMAT, were paid as provided for by the Labor Contract. The only exception was the pay of the Director. These rates were on a flat rate scale.

The original Director was funded for $15,000. But as of May 4, 1964, the new Director was paid at $13,500 per annum. The Assistant Director, functioning as of May 4, 1964, was paid at the rate of $12,500 per annum. Note: these two rates were less than allowable under the contract.

The office staff: manager, typists, and janitor were taken directly from the Civil Service lists and paid at the prevailing rates of the City of Detroit.

During the second year's operation, the U. S. Department of Labor, permitted modest raises, in keeping with pay rates of the Detroit Public Schools for equal jobs.

This time there was a minimum - maximum level established. The actual rate depended upon the experience and technical background of that particular individual.

Some discussion was evident among some of the Civil Service and Rate Section people of the City of Detroit, regarding high rates of pay for MYEP. There was some hesitation or varying degrees of reluctance on MYEP being able to promote at too rapid a pace.

Under the second year's contract the Director moved to $14,500 per annum and the Assistant Director to $13,500.

As the contract year drew to a close plans were tentatively made to comply with TAP's request that MYEP move under the control of the Total Action Against Poverty Program. As a result of this planning, the Civil Service Commission and the Rate Section were asked by TAP to review the job specifications and rates, to bring them into line with the prevailing hierarchy of the TAP structure. (For a final report on this amalgamation see the July-August Bimonthly Report).

J. PEOPLE - NOT JOB SPECIFICATIONS

As noted earlier in this paper, all personnel assigned to MYEP, with the exception of the Director and the Work Education Coordinators/Teachers, were from the established lists of the Civil Service Commission.

It has been the extreme good fortune of MYEP to have established a rapport with the Civil Service Commission. They have been most understanding in the great many problems of staffing a Special Project. The Civil Service Commission staff have moved to the extreme limits in the staffing of MYEP. As indicated with a 97% turnover in staff this has engendered a great deal of work for the Commission. But-- there were limits established by City Charter and Commission policy.

Many institutions, both private and public, have established Job Specifications and codes for each and every job within their hallowed halls. These specifications have spelled out the requirements to the applicant in terms of tests, types of tests, educational background, business-industrial experience, personal references, oral interviews, dress, and residency. Some, it has been reported, resort to : lie detector tests, investigation by private detectives, home visits at dinner time, and other devices not entirely known to the writer but referred to in various management journals.

Since the numbers of agencies and the methods of selection are as varied as the sands of the sea, let us devote our energies to those public agencies serving human beings.

It seems relatively easy for someone to receive an assignment of writing a job specification and of developing the requisite tests.

Apparently it is just as easy to talk to someone of related authority and/or go to the library for a little research, then sit down and write the "Specs" and tests. These are then reviewed by staff members following which they might be presented to an advisory committee. Simple? Yes, except it has left out the most important element--the individual. How does one measure ingenuity, creativity, motivation, respect for human dignity, administration-peer-trainee rapport?

Is the institution purchasing the person who fills, on paper at least, the job specifications or the individual who can accomplish the aims and objectives of the part and thus the whole?

Many persons who have the "right" specifications to fill a position have failed miserably when given the true test--actual performance. Conversely, many who did not meet the paper requirements, but were employed on an emergency/temporary basis, have performed beyond all requirements and expectations. When the job is completed, one doesn't ask, "What were the job specifications that did it?" Rather they ask, "Who did the job?"

Since the specially constructed tests developed by the Civil Service Commission were used originally to meet the needs of SYEP/MYEP, new and different types of individuals were drawn to the program. Perhaps the new face moving into the professional area of federal programs might best be characterized by the following: The Advanced Management Journal, April, 1966, contained an article by James Wallace. The article, "A Profile of Tomorrow's Executive," expresses

the feelings of this writer in a most complete and analytical fashion.

Mr. Wallace's projection into the future reveals that his concerns are mainly people oriented. He has listed nine general headings which are noted here.

"1. He will be mature.

2. He will have force, direction, and decisiveness.

3. He will have enthusiasm.

4. He will be a model of humility and graciousness.

5. He will be adjusted in his environment.

6. He will be adaptable.

7. Our 1975 business chieftain will have more formal education than his predecessor.

8. Tomorrow's executive will have imagination and

9. He will be a man with certain special spiritual qualities." [1]

Mr. J. Maurer III , an instructor at Wayne State University, has called these ideals "pious platitudes." [2] It does appear that John W. Gardner would disagree. He has stated:

> "Modern technology need not destroy aesthetic, spiritual and social values, but it will most certainly do so unless the individuals who manage our technology are firmly committed to the preservation of such values."
>
> "The man who has established emotional, moral and spiritual ties beyond the self gains the strength needed to endure the rigors of freedom." [3]

Of the original professional OMAT staff starting out May 4, 1964, only one had had a Civil Service and/or City of Detroit background. The selection process was open to anyone, city employee or not, who wanted to try for the positions. It must be assumed that some persons working in other City of Detroit Departments tried to become part of the SYEP/MYEP staff.

Therefore, of the seven professionals, one was a former Welfare Department employee, one a university guidance and counseling specialist, two teachers, one a vocational department head, one an Olympic track star, and the last one a language department head at a private school. All were apparently impatient with the status quo. All felt what John Gardner meant when he stated: "The only stability possible is stability in motion." [4]

K. COMPOSITION

A. Work Education Coordinators/Teachers

Unless noted, all of the sections of this report are dated back to January 1964. Since this date, MYEP has had a total of 20 Work Education Coordinators/Teachers. Of this total, 13 were Negro.

As indicated before, the WEC's/Teachers were selected because of their desire to assist youth, educational background, and/or work experience.

From a subjective view, it appears that there has been no known resentment or friction between the WEC's/Teachers of one racial origin and trainees of another, this provided that there existed a mutual understanding; this observation could only be gained through actual performance under the circumstances.

B. Office Staff

The office staff was requested on an as need basis from the Detroit Civil Service Commission's functional lists--that is the individual at the top of the list and is the one assigned when the request is received. No deviations are permitted.

C. Summer Staff

In the summer of 1965, the Mayor's Youth Employment Project was asked to direct Project Growth, an E & D program that included an agricultural experience.

Planning for that summer was also hampered by the time element. A call was placed to a number of outstanding leaders of the Negro community requesting their assistance in recruiting summer staff. The prospective summer staff would be referred to the Civil Service Commission for the necessary tests (special) for selection.

The recruitment efforts were also carried on at the various colleges and universities in the area. Graduate students in the areas of sociology and psychology were emphasized.

Both efforts stressed summer employment, hard work in the city and at the agricultural setting (24 hours a day), a chance to increase their practical knowledge in the psychological and sociological fields and to serve a truly disadvantaged youth.

As the project got underway, a summer administrator and four counselor-coordinators were employed. All were Caucasian not by selection but by application and Civil Service qualifications. The Mayor's Youth Employment Project employed one consultant in the field of physical education. He was Negro.

In the summer of 1966, Project Exploration was designed and implemented. Once again the many options were exercised in the recruitment of staff with the Civil Service Commission being the screening and final selection authority.

And again, the summer administrator and the eight counselor-coordinators that reported to the project were Caucasian.

It must be stated that for the two summer projects a total of fifteen summer staff were employed. All were Caucasians with the exception of the physical education consultant. This gentleman was employed directly by the Mayor's Youth Employment Project. He was a teacher in the Detroit Public Schools. As a consultant, it was not necessary to use the Detroit Civil Service Commission.

D. <u>OMAT Staff</u>

During the operational life of SYEP/MYEP, which covers the period of time from January, 1964 to June 30, 1966, the OMAT staff numbered some 33 professionals. Of this number, 9 were Negro and 24 Caucasian.

As noted earlier, the Mayor appointed the primary OMAT staff prior to the Civil Service Commission developing the necessary job specifications, codes and tests. This enabled the project to move out quickly. Of the appointees, three were Negro and four were Caucasian.

Following the change over, May, 1964, all of the applicants for the OMAT staff were qualified by tests--oral and written--at this time, two were Negro and five were Caucasian.

As time progressed, an increasing upward mobility pattern developed. When the contract was developed for April 1, 1965, only five of the original OMAT staff remained that started in May, 1964.

D. V. Healas, Director, Dr. M. Tucci, Assistant Director, H. Stone, Job Development and Placement Specialist, J. Cotter, Counselor and B. Bradley, Test Specialist. With the new contract the word "Senior" was officially added to the senior level person in each department so that a responsible person could be held accountable. The new contract also provided for a moderate increase in staff and salaries.

In June, 1965, Dr. Tucci, Assistant Director, left MYEP to direct Active Community Teams Inc., a juvenile delinquency control program.

Shifts in personnel were made, once again based upon the original Civil Service test results and experience.

The following moves were made: J. T. Cotter was made acting Assistant Director, H. Stone was made Senior Job Development and Placement Specialist, Dr. W. Welke, Senior Counselor, B. Bradley, Senior Test Specialist. As noted, "Senior" level tests were not available, therefore, the "promotions" were based upon past test results and on the job experience.

Points that might be worth mentioning as part of the writer's observation:

One of the Negro WECs had mentioned that she was "tested" by her Negro girl trainees. They did not believe that she had been poor or disadvantaged. They questioned her as to the food she ate and where she lived as a young girl.

Another Negro WEC tried to talk to the trainees in their own "street" language. But the trainees saw this as something put on and only tolerated it as they laughed behind his back.

A Caucasian WEC, a football coach and referee, developed a rapport almost instantly with his all male trainees.

A professional member of the OMAT staff, and a Kentuckian by birth has perhaps made the greatest contribution to single and groups of trainees and to various outside agencies as represented by the Detroit Urban League, the Flint Urban League and the Trade Union Leadership Council.

The trainees were quick to sense a false facade by any member of MYEP.

It will also be noted that when the incumbent Mr. Conrad Mallett, Job Training Supervisor left for a Mott Foundation Scholarship, he was not replaced. The reason behind this move was the fact that the number of WECs/Teachers was cut from 14 to 4 and the Detroit Public Schools furnished a Team Leader (Senior Teacher) for supervision.

Perhaps due to the mobility pattern, one year Federal contracts, and the Civil Service Commission's standing lists, there were no Negro senior personnel in MYEP. It has also been the policy of MYEP to promote from within wherever possible and permissible.

Another possibility is the result of the Civil Rights Act of 1964 and the awareness of the sociological changes taking place in the employment posture of the greater Detroit area.

At one time, according to Mr. Conrad Mallett, he was encouraged to strive for a civil service position in one of the governmental agencies, specifically the U. S. Post Office. But as a result of a continued interest by a teacher, Mr. Mallett readjusted his level of ambition to match his ability. Mr. Mallett became a police officer, a teacher in the public schools, Work Education Coordinator and the Job Training Supervisor for MYEP. He left for a Mott Foundation Scholarship, returned to TAP as Director of Staff Training and now has been appointed Assistant to the Mayor.

Mr. Bill Raymond, Director of Job Development for the Detroit Urban League has stated that he "...cannot find enough qualified Negroes to fill the professional job requests."

These statements might suggest that the highly qualified Negro is seeking his rightful niche in the private sector instead of the traditional job openings such as the Post Office, Department of Public Works, Detroit Street & Railways and others of similar nature.

A recent study reported by Dr. Garda W. Bowman in the "Harvard Business Review" indicates that:

> "However, one striking difference emerges. In the earlier metropolitan New York pilot study, the chief deterrent to promotion on merit alone was identified as executive's fears regarding the effects of management integration on production, prestige, and profits. In HBR's national study, a year later, these fears appear to be substantially lessened. Today the phenomenon of Negroes as managers is no longer an extreme rarity. Pressures for equal opportunity have been increased both through government action and through the Negro leadership. Management is taking a hard look at its own attitudes and behavior; the end result is that purpose rather than fear is the dominant note in the HBR responses." 5

L. EDUCATIONAL BACKGROUND

A. Work Education Coordinators/Teachers

The WEC's/Teacher's formal educational qualifications ranged from high school graduates to post masters programs.

A number of these had regular State of Michigan Teaching Certificates. The others were provided with Emergency Vocational Certificates through the Detroit Public Schools and the State Department of Education.

The primary reason for employment as a WEC/Teacher was a combination of items. Knowledge of the world of work, industrial/business experience, education and respect for the dignity of man were the items considered.

B. Office Staff

All of the office staff were high school graduates. Some of these were involved in post-high school educational programs.

C. OMAT Professional Staff

All of the OMAT professional staff were college graduates. Many were involved in graduate work at the masters and doctoral level.

The various disciplines represented included such areas as, guidance and counseling, testing, administration, industrial-vocational education, sociology, philosophy, psychology and higher education.

Throughout the period of operation as either SYEP or MYEP the professional OMAT staff was selected via the criteria as

established by the Civil Service Commission. One of the basic requirements was the college degree as a pre-screening device, although there was a small clause that might permit a person with just less than a degree to be accepted. All OMAT senior staff possessed at least two academic degrees.

The Director of SYEP/MYEP was encouraged by the Civil Service Commission to sit in on the oral portion of the total evaluation of candidates. The candidate had to pass the written portion of the battery before he was eligible for the oral interview. It was during the oral interviews that the Director could make known the philosophy and, therefore, the intent of the Project. One of the feelings of the Director is expertly expressed by Alfred N. Whitehead:

> "You cannot be wise without some basis of knowledge; but you may easily acquire knowledge and remain bare of wisdom."[6]

Another area of watchfulness was the past record of "creativity," "innovation," and "flexibility." Robert T. Golembrewski described the feeling as:

> "...Whyte's celebrated complaint that the bias of much personality testing is to select organization men who are uniformly bland, if they are not stultified conformists."[7]

This Project was built around the individuals of the staff and functioned for the individual trainees.

These three items--"creativity," "innovation," and "flexibility" --were perhaps the key to what success SYEP/MYEP encountered. As a total team effort each and every member of the Project voluntarily wore a number of hats as the need arose. The interchange of activity

or functions was established by the Director's example and carried down through every level.

Stanley Sadofsky and Melvin Herman reported Curtis Aller as saying:

> "Most (personnel at the OMAT Training Conference), perhaps by virtue of their assigned duties, appeared to be highly specialized and less than knowledgeable or communicative about other disciplines or specialities involved in their projects...In an ideal situation most project people would be generalists: that is, a counselor at one point, a trainer at another time, and a supervisor at still another...I felt that there may be a tendency toward too much division of labor in the projects and that an effort should be made to utilize a team concept headed by a multi-occupational leader to offset the contrifugal tendencies of specialization."[8]

SYEP/MYEP staff were not only developed experts in their particular fields; they also applied their wide background experience to becoming generalists in the true sense of the word.

Once again the work of Melvin Herman and Stanley Sadofsky is used to point up some of the difficulties encountered and overcome:

> "All of the respondents in this study felt that directing a demonstration project or a work program was an extraordinarily demanding position, requiring an unusual combination of technical and administrative skills. Only an experienced, competent administrator, they claimed, can survive in the chaotic political and bureaucratic environment in which these programs must be planned and operated."[9]

M. ORGANIZATION

Prior to May 4, 1964 the organization, as shown by Chart #1 was set up on a functional basis. There were apparently some loose ends.

On May 4, 1964, a new table of organization was detailed.

As a result of the new position of Assistant Director, the Director could then spend additional time in establishing coordination between other agencies and the reestablishment of a rapport that was not nurtured.

David Jinowes, in an article for "Management Services" has pointed out that:

> "The Chief Executive Officer is the most important single function...If preceding one officer was good, a pattern is followed. If he was poor, the new has to establish duties without model."[10]

However, unless the senior level positions were immediately involved and in turn the rest of the staff, MYEP would not have been able to recover in the short period of time that it did.

The organization of MYEP was not unlike the sands of time, shifting and flowing.

Constant evaluation of the total program often indicated changes to be made in order to accomplish the objectives.

As pointed out, the organization chart is cold and impersonal until human beings are slotted in. Then it becomes a people-oriented map.

As noted, the Organization Charts #1 and #2 are somewhat different. Chart #3 came about as the need for areas of authority were found. This included the collection of data for reports to various agencies, the need to establish a working liaison with local agencies, and the internal-upward mobility of staff. As a consequence, the third organization chart was designed with attendant coordinating functions.

Note that the word "Senior" was included to denote the section head - department head. This was accomplished in advance of the refunding date to show a need and prior service so that upward mobility would be strengthened at the new contract time.

N. BUDGET

Since the budget was established prior to each contract period, it remained inflexible to a point. Deviations were permitted with the full concurrence of OMAT and MYEP and with the noted changes brought to the Common Council of the City of Detroit for their approval.

As with all Federal contracts the following steps are requisite.

1. Must be approved by:

   The U. S. Department involved
   The Mayor of the City of Detroit
   The Common Council
   The various City Departments involved
   The agency submitting the request

2. They may be cancelled upon due and timely notice by the Federal Government.

3. Bond must be posted.

4. Bank accounts and/or City of Detroit voucher systems must be established.

5. Equal Opportunity Act must be complied with and verified.

As indicated, the City of Detroit provided the means to account for the funds through its various departments. This applies to the grants that came directly to the city.

TABLE OF ORGANIZATION #3
MYEP-April, 1965

The grants from the U. S. Department of Health, Education and Welfare for WEC/Teachers, were channeled through the Michigan State Department of Education to the Detroit Public Schools. The Detroit Public Schools through its office of federally supported programs, were responsible for those funds.

All petty cash, the loan fund, medical fund, purchasing and requisitioning were performed within keeping with the rules and procedures of the federal agency and the City of Detroit or the Detroit Public Schools.

O. PLANNING

As stated before, the initial planning of SYEP/MYEP was accomplished by the Community Action for Detroit Youth. As a result of this planning and direction of Mayor Jerome P. Cavanagh, a long range plan of attack was established. But the staff apparently failed to key in the short and intermediate range plans.

Therefore, a review of the original planning was instituted. From this, immediate programs were developed to set in motion a truly integrated project.

The Team Concept evolved after ascertaining the staff's willingness to:

Accept risks
Be creative
Be innovative
Be flexible

The object of the Project was the individual trainee as seen by individual staff members. This was followed by the bringing together

of this "mix" in the most effective manner to serve the trainee.

The planning of specific training programs required the coordination of many individuals and/or agencies including the:

Michigan Employment Security Commission
Detroit Public Schools
City of Detroit
Mayor's Youth Employment Project
U. S. Department of Labor
Bureau of Apprenticeship & Training
Technical Advisory Committee

and all the individual components of these agencies. A complete listing of the agencies and/or individuals may be found in Appendix A.

P. STAFF DEVELOPMENT

As indicated there has been a high rate of turnover in the staff of SYEP/MYEP. As a result, a continuing training program has been in effect.

Although there has been no specific funding or staff assignments for this purpose, it has been a "must" item in any planning procedure. Robert K. Stolz discusses this view concerning industry's approach; he points out:

> "Leading companies make no bones about having dropped the pomp and ceremony which was characteristic of their executive development programs in the early 1950's. But they distinguish sharply between (a) the formal programs and (b) the organized, managed approaches designed to stimulate and help their managers build confidence."
>
> "...companies that devote the most attention to developing management talent are those that consistently lead their industries in profit growth..."[11]

"Success" might well substitute for "growth" in the case of SYEP/MYEP.

The incoming staff person has already "proved" himself as prepared for a particular level of competency within a discipline "on paper." This point is verified by the Civil Service Commission's certification to the Project. As a result there is a base from which to start. But as Alfred N. Whitehead points out:

> "You cannot be wise without some basis of knowledge; but you may easily acquire knowledge and remain bare of wisdom."[12]

Another thought about the "competency on paper" was highlighted by Robert Golembrewski,

> "...Whyte's celebrated complaint that the basis of much personality testing is to select 'organization men' who are uniformly bland, if they are not stultified conformists and there is a long tradition that individuals should be adapted to 'the organization' rather than it to them."[13]

Generally, there has been little or no time to phase in the new person. He reported into the Project the day he cleared personnel. The person was then introduced to the senior level person in charge of his department, and then the rest of the staff.

The "buddy" system was used to further the educational tasks and the philosophy of the Project. This required, because of the lack of time, that orientation and training take place on-the-job. Using this in-house training technique plus continuing conferences-discussions, job rotations and special assignments has lead to a highly cohesive unit.

The majority of the OMAT staff were involved in graduate programs either as students or instructors. As indicated before, this

staff group was unique and self-motivated. Although a variety of disciplines were represented, they were interwoven and interlocking. Each move up the academic ladder was backed or reinforced by practical experience at the Project. Patricia Sexton has indicated that:

> "Reading is not the source of all knowledge. Without experience in the real world book learning is often worth less than nothing;..."[14]

In-service programs were held for all of the staff at various levels. This program not only called upon the various staff members but also used the services of many professionals from other agencies.

Wayne Foreman recently reported his study that is best expressed in the following table:[15]

N = 45

Training Techniques	Time Appearing In Top 5	%
OJT	43	96
Conferences & Discussions	42	93
Job Rotation	34	76
Special Projects	32	71

SYEP/MYEP cannot lay claim to creating such programs, but the Project was in excellent company.

Robert K. Stolz has indicated that:

> "...the primary purpose of development action is to test the man under fire."[16]

This is a reinforcement of perhaps one of the major criticisms of "role playing" and "gameship," as a technique in training. This may be related to the "Escape and Survival" course offered by the

U. S. Marine Corps in that no matter what happened to you, you knew it was a "game" and would be over in two weeks. These teach techniques but do not necessarily test your reactions in the world of work, where decisions count. This is especially true in the human sector over the material sector.

Q. FORMAL TRAINING

It has been stated that:

> "Man's knowledge has doubled between 1950 and 1960 and will double again by 1968."[17]

With this in mind it appears that the executive of a Federal Project must devote a great deal of energy in reviewing the ever increasing volume of literature to keep up to date. Not only is this executive reading about innovations in management but he is often, more times than not, creating, enforcing or denying them, at least in specific areas.

This not only applies to the management field but to the other disciplines that support the total programs. For instance, in the field of social work, education, guidance, and counseling the changes brought about in the last year or two have not been well documented in the various textbooks.

In the field of management many companies and some universities have been working together to design and implement executive development programs. Kenneth Andrews has indicated that:

> "Eighty-two per cent of the 10,000 participants evaluated favorably their attendance at the university executive development programs."

> "Of the adverse comments, the most frequent one (occurring 130 times) is that a few of the faculty were too academic, with inadequate business experience."[18]

This has been the writer's experience not only in a management program but also in some of the educational programs at the same university. It appears that in most of these cases both recorded and others, that the main trouble has been too little experience on the part of the instructor either because he was recently graduated from college and is now working on his Ph.D. and teaching, or that he has earned his Ph.D. long ago and is not conversant with the changes that have come about within his discipline.

Another thought has been provided by Robert R. Blake et. al., when they stated:

> "...most behavioral scientists do a better job of communicating technical findings to each other than they do of communicating the relevance of their research to practicing managers."[19]

A great deal of theoretical research is needed in the vast developing field of management. There is also an equal need for a pragmatic, systematic approach to teaching the vast complex of business administration. But should the two be one? The writer feels not. The two disciplines must retain separate, but bridged by an interruptive link.

R. SUMMARY

The SYEP/MYEP was successful if measured in terms of the trainees and their graduate records of employment, wages earned, taxes paid, and most importantly, the movement of the graduates into the mainstream of the American way of life.

Perhaps the most distinguishing or significant point in answer to the question "Why was it successful" appears to be interest or belief in the individual trainee. Other factors are involved but seem to be supportive rather than primary.

As for the staff and management side, Charles Myers expressed it well as he stated:

> "...effective authority in many groups, particularly in management and R. & D. circles, comes from mutual confidence and trust between organizational superiors and subordinates as epitomized in McGregor's Theory Y or in Blake and Mouton's 9,9 Management."[20]

Peter F. Drucker has also pointed out that:

> "What pulls people together in an organization is a common sense of purpose."
>
> "Invariably I have found that the ones who have results to show for their knowledge are not the ones with the largest accumulation of Ph.D.'s on the staff or the largest amount of expensive equipment. They are the ones where the research director has regularly asked himself and his scientists: What contribution have we really made this year to the business and its performance?"[21]

The writer might make a few substitutions so that the last sentence might read as follows:

> "They are the ones where the <u>director</u> has regularly asked himself and his <u>senior staff</u>: What contribution have we really made this <u>month</u> to the <u>trainees</u> and <u>their</u> performance?"

SYEP/MYEP senior staff have engaged in all of the managerial functions: planning, staffing, organizing, direction, and control. The time element, end-product, and internal-external pressures may differ somewhat from the established business institution.

The time element has been reduced to 1 year only for planning purposes. As a result, all of the other functions are reduced in time but magnified in intensity.

The end-product for SYEP/MYEP has been the human being and his upward movement.

The internal-external pressures are similar to the pressures of the major companies but with the involvement of the established-traditionalist institutions and the people of the community.

E. PROJECT IMPACT

Internal Evaluation Mechanism and Purpose

An internal evaluation mechanism is a valued necessity for any institution, agency, or business. It is especially valid for an Experimental and Demonstration Project. The main function is to evaluate the program continually and systematically, not just the end results. By this method the staff can make the necessary adjustments at that point in time, to keep the known objectives in sight or can reevaluate and shift the direction of the program so that new objectives can be reached.

The internal evaluation mechanism of MYEP was made up of a number of interlocking parts. The regular and special reports, group discussions, formal and informal staff meetings, the Technical Advisory Committee meetings, intra-agency meetings and the Mayor's Office. Of course, the ultimate evaluation has been: Were the trainees employed, how long and are they able to advance?

Weighing Success

As stated above, the ultimate end was the effect upon the trainee. The Project was oriented to the trainee as an individual. MYEP was not out to play a numbers game. It's prime concern was the trainee's present and future. It is relatively easy to "prep" trainees for entry into a job, but quite another thing to prepare them to sustain employment and grow productively.

MYEP conducted a follow-up study in the fall, 1965 of it's trainees. Using the known data the Project was able to assume that

about 75% of the trainees were still employed after the first year. Subsequent studies by the Detroit Board of Education and the Michigan Employment Security Commission confirmed this percentage.

MYEP has received unsolicited letters from a number of trainees indicating their appreciation of the program.

Comments from the vestibule station supervisors have generally indicated a great deal of surprise and admiration for the individual growth of the trainees.

Another of the indicators of the success of the trainees is the information gathered by the Job Development and Placement Department on their calls back to employers who have hired the products of MYEP.

Approximately 72% of the trainees in the MYEP study were in families who were collecting some form of relief. As indicated in the study, the wages earned by trainees were estimated to be $3,500,882. The total taxes paid by trainees were computed to be $477,696 using the wages indicated as a base. All the computations were figured on the low side. It became evident that the total expenditures for the Project would be offset by trainee earnings and taxes paid within one year after obtaining employment.

Above, and certainly beyond the numbers game, the individual trainee is the object of the main thrust of the program.

Feedback to Public and Private Agencies and Programs

Without the help of hundreds of individuals, MYEP could not have achieved the full measure of success it enjoyed during the 1965-1966 contract year. These individuals may have been an auto mechanic who

trained, coached, encouraged, and counseled a rebellious trainee or a Vice-President in charge of personnel who opened employment channels for our trainees. They may have been a business executive who devoted one night a week to tutoring an ex-convict, or a doctor who took time from his private practice to conduct, a special medical clinic for our trainees. The support of these individuals, and the businesses and agencies they represent were crucial for the past success, and continuing success of MYEP. Because of the outstanding service rendered to our trainees, it was felt that a formal type of recognition should be given to those individuals and agencies who had provided the services.

A Reception of Recognition was planned to perform the two-fold purpose of giving recognition to deserving individuals, agencies, and organizations, and to reinforce the cooperation they had demonstrated during the past year (see appendix). Individual awards signed by Jerome P. Cavanagh, Mayor of Detroit, were presented to each person who worked with MYEP trainees.

II. RECRUITMENT

General

This section of the report must be viewed as an integral part of the overall program. It is not possible to adequately describe "a" best method of recruitment and divorce that section to make retrieval of information more systematic. The methods, techniques, knowledges, and skills developed over a span of three years cannot be arbitrarily classified to simply itemize a few categories of what, and how, to reach the trainee. Recruitment for a program is determined by the goals established for that specific program, and techniques utilized in one instance may transfer value in securing additional trainees for a program that is of another nature.

The purpose of this report, then, will be to clearly delineate specific types of recruitment for specific programs conducted by MYEP during the period of April 1, 1965 to July 1, 1966. The contract specified that recruitment of trainees would be performed by the Michigan Employment Security Commission and/or the Contractor.

While both types of recruitment will be described, the greatest emphasis will be placed on recruitment activities of the MYEP staff, as this was a critical factor in the experimental aspects of this demonstration program.

A. Recruitment by Michigan Employment Security Commission

The Michigan Employment Security Commission has a variety of methods for trainee recruitment which could be best described by that agency. The regular programs conducted by the Mayor's Youth Employment Project were filled by trainees supplied by MESC. Basically it was implemented in the following manner.

A young person wants a job. This may be discovered by a mobile unit working in a neighborhood, or the person may walk in to one of the MESC centers seeking a job. There the person is interviewed, fills in an application, talks with a counselor, is tested, and an occupational goal established. He may go directly to employment, enter various training programs, go back to school, or college, or be placed on a waiting list for openings in either employment and/or training. When MYEP was ready to start a new group, a request was made to MESC to supply trainees who had an interest and aptitude for that specific type of training, i.e., auto-mechanics, clerk-typists, nurses aides, metal processors, etc. The trainees reported to MYEP and began training on the day they reported. The purpose of the Mayor's Youth Employment Project as an Experimental and Demonstration Project was to develop new and effective techniques of

working with a disadvantaged population. For this reason, the remainder of this recruitment report will describe various methods used in special recruitment for experimental programs.

B. Recruitment by Mayor's Youth Employment Project

The most meaningful method of describing MYEP's recruitment activity would be to give a capsule summary of specific programs, and then relate concrete examples of recruitment and community penetration. The following will indicate a specific program and then comment on the items listed in "Outline for Operation Retrieval."

1. The Police Program

At the request of the Commission on Community Relations and the NAACP, MYEP was involved in working with young men (21 years and over), who wanted to be police officers, but who had failed the entrance examination. The recruiting for this program was conducted by CCR, with the cooperation of the Detroit Police Department. The program had the twofold purpose of academic improvement, and physical fitness. Because these young men are presently employed, and do not meet the MDTA requirements for special allowances, the program was conducted on Saturday. Mr. Bradley, Director of Testing, volunteered his time and services, for this program. If this experimental program was successful, CCR planned to write a proposal for a full-fledged program to prepare minority youth for employment with the Detroit Police Department.

The method of selection for this program was established by screening the scores of all the young men who failed the examination for police officers. As the purpose of the program was to work with minority youth, and Negroes in particular, a hierarchy was established by such identifiable data as, area of the city, church denomination, name, high school attended, etc. When the list was completed, each person received a phone call, or letter inviting them to attend an orientation meeting designed to answer specific questions about the program. The meeting was set up for Saturday morning because it was the most convenient time for the majority of the group. The immediate monetary inducements were minimal, in that no training allowances were paid during the program. Most of the young men were employed in entry level jobs on a full time basis. However, possibility of having a secure future, with monetary gain in the future, may have been a motivating factor. The status inducements, i.e., being a police officer, was a far greater motivating factor. The impact of social groups on recruitment could be considered negligible in this case. The young men had been motivated to apply for police work before they were recruited for the program.

The purpose of the intake interview was to orientate the individual as to the specifics of the program, and to do a surface evaluation of the trainee's strengths and weaknesses. The holding time between intake and training is always as short as possible. In this case, training began at the next meeting a week later, and

continued on a weekly basis until the termination of the program. In this instance, the number of trainees did not exceed the intake quota, so services to the non-eligibles was not a problem.

The recruitment techniques used in this experimental program might be described as a "rifle" technique. They were zeroed in on a particular group; activities would, of necessity, be aimed at a much broader base because a full-blown project would have the time, staff, funds, and facilities to work on a long range program. The next type of recruitment to be described is a "shotgun" technique, inasmuch as the population required could have various backgrounds, interests, and educational levels; and a wide variety of occupational choices would be made available to the individual.

2. Project Growth

The purpose of Project Growth was to recruit young men who would work on farms in Michigan for a period of about four (4) weeks and then enter an MDTA training program designed to provide specific occupational skills.

This was MYEP's first experience in direct recruiting. The local MESC office informed the Project that it would not be possible at that time to secure the necessary number of young men for the program. The Project was also given permission to recruit in whatever way it could. A massive recruitment campaign was immediately started. It included the following types of mass media:

Newspapers - Ads

Detroit News	2 Sundays	808,000
Detroit Free Press	2 Sundays	575,000
Michigan Chronicle	1 Wednesday	57,000
Eastside Shopper	1 Wednesday	50,000
Eastside Express		
Eastside Booster		
Harper Woods News		
Grosse Pointe Press		
Polish Daily News		34,000
English & Polish		

Newspapers - Stories

Detroit Free Press
Eastside Shopper

Radio Stations - Spot Announcements

WCHB
WJLB
WKNR
CKLW
WXYZ
WGPR

Television

WJBK

All of the above ads and announcements indicated a specific morning for the trainees to report. The entire staff was assembled to process the group, and arrangements were made with the local MESC office to supply personnel to handle an overflow crowd if need arose. A large restaurant chain in Detroit reserved all of its day old baked goods free of charge, and promised up to fifty (50) gallons of coffee would be made and delivered within one hour of the time it was

requested. The staff stayed late the night before the "big day", and arrived at 6:00 a.m. on kick-off day to ensure processing of the early arrivals. The net result of all the advertising--NOT ONE SINGLE PERSON ARRIVED TO REGISTER FOR PROJECT GROWTH.

The abject failure of the first recruiting efforts were, to say the least, disappointing. However, the next day a new approach was formulated. Approximately 6,000 flyers were printed and distributed to housing projects, youth agencies, churches, recreation centers, playgrounds, swimming pools, basketball courts, street corners--anywhere that young men might congregate. While this proved to be more successful than the mass media approach, the most effective method was to contact the youth directly, drive him to the Project, sign him up, and give him bus tickets so he could report the next morning. This meant recruiting at night, going back to where young men congregate, at basketball courts, pools, etc.---in short, it meant taking the Project to the prospective trainee instead of attempting to get him to come to the Project.

The following section is a report written by our most effective recruiter.

PROJECT GROWTH - RECRUITING REPORT

It is not the purpose of this report to investigate or compare different approaches to recruiting in various situations. Rather, this report will concern itself with recruiting in one situation where the only independent variable will be the types of approaches used in recruiting. During the summer of 1965, a low employment rate made a certain approach to recruiting necessary which at other times might have appeared unnecessary and almost wasteful.

The objective of this recruiting program was to secure at least 70 jobless young men between the ages of 17 and 21 for a vocational training and work-experience program sponsored by the Mayor's Youth Employment Project. The recruits also had to be either high school graduates or out of school for a full year in order to qualify for the program. The eligibility requirements in themselves greatly reduced or modified the recruiting approach and method.

When the recruiting program began, it's approach and technique could be compared to an experimental lab situation. We knew the response we wanted, the real problem was in finding the right stimulus which could work the desired effect. The desired response was, of course, recruits, as many and as soon as possible. Many stimuli were introduced before a satisfactory S-R relationship was achieved. When we found a satisfactory stimulus, it was reinforced and polished so that its greatest efficiency could be utilized. The remainder of this report will be largely concerned with evaluating these stimuli and their productive capacity.

Stimulus One

From my experience in recruiting this summer, I feel that it is highly advantageous to be well dressed when the recruiter is contacting parents or other organizations who may be acting as referral sources. The recruiter's impression upon people is a quick one and to these people, a well-dressed recruiter usually implies that the recruiter has something important to say and probably has the authority to back it up.

When contacting the young men themselves, I feel that it is even more important to be well dressed. A recruiter is fooling only himself if he thinks that he can become "one of the gang" in the short time that he spends with them. He is not one of them, and they can virtually sense this, no matter what he is wearing. If he speaks their language ("hey cat! hey man!") they can usually spot him for a phony or at best a good actor. I strongly recommend that the recruiter dress and speak the part of an employer or a person who is thoroughly interested and has authority to give his recruits a better job or training. In this way, the recruiter takes advantage of his position, uses it, and can give the recruitant the impression that he is taking a step in the right direction, both in terms of the people he will be dealing with and the success of the program in the past. I strongly feel that this is a very important aspect of recruiting and cannot be overly emphasized.

Stimulus Two

Formal or organizational contacts in themselves proved to be highly unsuccessful methods of recruiting. By formal or organizational

recruiting I mean the type of recruiting that does not involve a person to person contact between recruiter and recruitee. This would include public and private agency referrals, fliers and newspaper ads, radio and television announcements, telephone calls, speaking at parent clubs, and by any other indirect means of recruiting.

Why these methods proved unsuccessful is difficult to tell. Many of the organizations or agencies were probably too busy with their own business to give the necessary attention or time to our requests. Other things like the fliers and the radio and newspaper ads probably contacted only a very small percentage of the recruits that would be eligible for our program. The type of man that we were interested in didn't read the want ads or if he did hear about the program, it probably went in one ear and out the other. Getting the recruit while he is still enthused is a major aspect of good recruiting. This will be discussed in greater detail later.

After these forms of recruiting had failed, I depended almost completely on personal contact. I asked for lists of names from various organizations of young men who met our qualifications and our eligibility requirements. I then attempted to contact these people in person. This was a better method of recruiting and would have been excellent were it not for the fact that the records of these people were usually over a year old. At least 50% of these listed contacts no longer lived at their listed address. What this added up to was a lot of wasted traveling time to see people who didn't live there anyway.

The best recruiting technique actually involved a combination of formal recruiting (by contacting listed names) and informal recruiting. I found that the listed names usually carried me into areas where often large groups of teen-agers congregated. Although I continued contacting the listed names, they in themselves became secondary to the roadmap function that they had assumed. Recreation centers, porches, shopping centers, street corners, pool rooms, and "greasy spoons," all became the best referral agencies I had yet contacted.

Stimulus Three

Personal contact, however, is not enough. No matter how enthused the recruitee is, it usually manages to wear off by the next morning unless it is reinforced by something. "Get them while they're hot" certainly does not lose its application in this situation. Unless the recruitee finds a rare case of bubbling ambition, telling the boy to come in the next morning will do about as much good as handing him his discharge papers.

The basic theory is to do as much with the boy while he is still enthused as is possible. This is the technique that I used. I usually gave the boy an application, told him to fill it out and told the boy that I would meet him in a specified place after he had filled out the application (not more than 1½ hours after I let him go). After doing this with four or five young men, I then picked them all up together and took them down to the office. Besides being economical, there is good logic in taking the fellows down together.

First of all, they are more relaxed in groups and feel more at ease. Second, they get the impression that there are others who are interested in improving themselves and getting good jobs. In other words, they are not "loners."

After I got them down to the office, I never kept them for more than a half hour. I usually re-explained the program, had the trainees ask questions, and then gave them some forms to fill out at home. The main purpose again, behind the whole operation, was to get them started or use their enthusiasm while they still have it. If the recruiter can make the trainee feel as if he has already started or has already committed himself, then the chances are much greater that the recruitee will return tomorrow. To make the trainee feel that he is merely continuing tomorrow can mean a great deal in securing his participation in the next day's activities.

Stimulus Four

Another important thing for a recruiter to remember is not to indicate in any way that the recruiter needs the recruit. Communication of the recruiter should be in terms of "if you qualify," "if you meet the requirements" and "if you prove your ability." He must feel that he must prove himself worthy to get the job or else he will only give you half of what he is capable of giving.

Stimulus Five

Another obvious factor in recruiting is the distance from the school where the new recruits are trained. The closer the recruitee is to the training station, the more likely it is that he will return the next day.

Stimulus Six

Although processing and daily activities are not part of the responsibilities of the recruiter, as such, a well organized and efficient schedule can do much to keep what the recruiter brings in. If a new man senses disorder and chaos on his first day, he will transfer this chaotic situation to his opinion of the training station and what they can do for him.

Stimulus Seven

There is a pronounced difference in attitude between the Caucasian and Negro boys that I contacted. Working with the Caucasian contacts appears much less successful than working with Negro boys. The Caucasian contacts appear to be somewhat more embarrassed by my presence than their Negro counterpart. On the whole, they seem to regard my presence as a sign of their weakness and failure and do not like to be reminded of it. Negro youth, on the other hand, appear to have a more favorable attitude. They do not try to protect their status and seem more willing to accept me as a form of outside help. Caucasian contacts seem to regard me as some type of welfare, while Negroes usually regard my offer as an opportunity to be taken advantage of.

Stimulus Eight

Giving short range explanations and goals are important in any operation. They are also important in recruiting. It is too vague a statement for a recruiter to say something like, "Within a year, we can get you a good full-time job." A week by week explanation of the

Project program activities and GOALS are necessary if the recruitee is to gain a comprehensive outlook on the program. Short range goals are just as important for the recruiter as they are for the instructor of a classroom.

The future trainee must be able to visualize each phase of a program and his role in it before he can gain the enthusiasm that he needs to carry him through it. If the trainee can obtain a vivid picture of what the program can offer him, he is more likely to be an interested and a motivated trainee.

In conclusion, I would again like to stress the importance and the OVERALL EFFECTIVENESS of informal recruiting. Many young men who could not be contacted in any other way can be contacted through this source. Also, it is these men who need the most help and who probably would not make it, were it not for somebody actually going out and dragging them into the Project or program.

3. ST. LEO's PROGRAM

The program at St. Leo's Church was designed to help the members of the community who were in need of help in securing employment, or additional short-termed remedial instruction, to improve employment possibilities. Three qualified teachers volunteered their time to teach remedial reading and arithmetic, and MYEP staff members volunteered time for counseling, testing, and referral. Officially, MYEP was involved only in an advisory capacity. If this "Job Clinic" proved a success, the pastor indicated he would attempt to influence other inner city pastors to have similar programs as a parish activity.

The recruitment for the St. Leo's Program began with a visit to the pastor of the parish, Father John Morel. He indicated a willingness to cooperate in any manner feasible. With the help of Sister Ann Joachim, the high school principal, the following plan was formulated:

Father Morel would write articles and have them published in the church paper, he would talk about the program in each of his sessions, and contact the church organizations to get their support. Sister Joachim would have the grade school and high school students take flyers home, and also distribute flyers to the neighborhood. She would also contact by phone the families who were receiving some form of public assistance or help from the parish, St. Vincent DePaul Society (a society to help indigent families). After the recruitment had been under way for two (2) weeks, Father Morel would publish a progress report in the church paper.

St. Leo's Parish is located in a very poor section of Detroit. While the plan was to serve the indigent population of the immediate area, word-of-mouth advertising reached persons living many miles from the parish. There were no direct monetary inducements because no training allowances were paid. The Project services were set up, also a cafeteria made available by Father Morel. Past experience indicated the need for this population to bring the Project to the people rather than trying to motivate the people to come to the Project.

Concerning the impact of social groups on recruitment, the family, the peer group, and the neighborhood, all played an important role. It was not uncommon to have a parent and several of her teen-age children attend the same meeting. The first meeting was designed to orientate the group to the possibilities presented by the Job Clinic, and to secure background information through the use of individual interviews.

There was no holding time between intake and training. Some of the individuals were referred out to jobs the first night. No intake quote had been established. If the intake exceeded the staff capabilities, qualified volunteer help was available. No restrictions were set, so it wasn't possible to have a "non-eligible". The recruitment resulted in a group of about 100 persons with ages ranging from 14 to 68, and educational levels from about the 4th grade through college.

The recruitment activities for the St. Leo's Job Clinic is best described as the "shotgun technique." A wide range of referrals, training, and job placement was available to the group. One result of this experimental program was a series of meetings with the Michigan Employment Security Commission designed to facilitate referral procedures from mobile recruiting teams, follow-up techniques, and more cooperation between agencies dealing with disadvantaged persons.

The following page presents a sample of the flyers distributed to the community.

ST. LEO'S JOB CLINIC

St. Leo's Parish is sponsoring a Job Clinic survey with the cooperation of the Mayor's Youth Employment Project. The following is a FACT SHEET about this program:

PURPOSE: The purpose of this program is to help people in this community who:

1. Are unemployed and want a job
2. Are employed, but want a better job
3. Would like to have vocational testing and counseling services
4. Would like to know about various vocational programs available to youth and adults

WHEN: This program will be established as soon as this, and other survey work, indicates the community is interested.

WHERE: The Job Clinic will be held at St. Leo's High School.

TIME: The time of the program will be established when most people can attend. This might be in the evening, on Saturday, or on Sunday.

COST: There is no charge for this program.

WHO: Any interested person may attend.

HOW: This program is based on individuals. If a large enough group (15 or 20) have a common interest, classes will be started to help prepare a person for employment, or find better employment.

In order to find out how many would be interested in such a program, we are asking you to fill out the following questions. Please return the completed form to school as soon as possible.

	YES	NO
1. Do you feel this program could help the Parish?	_____	_____
2. Is there anyone in your family who is interested in this program?	_____	_____
3. Do you know of a friend or neighbor who could use the services of the Job Clinic?	_____	_____

4. Please fill in the following if you would like to attend a Job Clinic (if you are not interested, perhaps a friend relative, or neighbor who is interested might fill out this section.)

5. NAME _____
ADDRESS _____
PHONE _____ AGE _____
EMPLOYED: YES _____ NO _____
When would be the best time to have the Job Clinic:
Please check one: A. evenings _____
B. Saturdays _____
C. Sundays _____

4. PRE-APPRENTICE PROGRAM

During the time when there was a lack of qualified young men to enter apprenticeship trades, this is particularly true in the case of minority youth, MYEP, in cooperation with the Detroit Board of Education and MESC, was given permission to recruit young men from the inner city schools. These indicated an interest in the apprenticeship field, but lacked the necessary skills and knowledge to qualify for apprenticeship training.

The purpose of this program was to provide a short-termed high impact course for selected trainees to prepare them for admission into the apprenticeship field. If successful, the Detroit Board of Education had indicated the possibility of including a similar program as part of the regular high school curriculum.

The recruitment involved the cooperation of three parties: the Michigan Employment Security Commission, the Detroit Board of Education, and the Mayor's Youth Employment Project. These three agencies worked together quite harmoniously.

The Detroit Board of Education was most helpful, especially its Assistant-Superintendent, Dr. Carl Byerly. Meetings and agreements between Dr. Byerly and MYEP staff members established the foundation for the program. Permission was granted to MYEP to present the program to young men from two schools--Northeastern and Northwestern. The men, all destined to be January, 1966 graduates who were interested were given some preliminary tests and then interviewed individually. The result was that a group from each school was scheduled to begin training after graduation. MYEP agreed to follow the suggestion of

Mr. Westly Rea that actual training and further recruitment begin after graduation, since to begin before that date would be too demanding of the students. Therefore, at the end of January the new trainees were registered with MESC and the program began.

Each trainee who qualified received an allowance through the Michigan Employment Security Commission. MESC agreed to come to the MYEP headquarters and register the group from each school. This procedure greatly simplified matters and the cooperation of Mr. Trolley, Mr. Novak, and the MESC counselors was greatly appreciated. As new trainees entered the pre-apprentice program in groups of an agreed size, MESC continued to register them for allowance. In return for this courtesy, MYEP kept MESC informed as to the progress of each trainee. Once the program began, the Work-Education Coordinator was given the task of recruitment and he worked with the Board of Education and with the MESC. As a result of this recruitment, two small groups of trainees--there were about seven in each--entered MYEP during March and April. Although the Pre-Apprentice Program is a project of the MYEP, it should be quite apparent that its existence and operation would not have been possible without the cooperation of the aforementioned agencies.

The Pre-Apprentice Program is another example of a "rifle technique" in recruiting trainees for a specific experimental program. Generally speaking, the requirements to enter an apprenticeable occupation in the Detroit area are seemingly higher than the requirements to enter some of the universities. This is not surprising when one is cognizant of the fact that a tax supported institution has more latitude in accepting a marginal student than business or

industry. A student who drops out of college after the first or second year presents no threat to the college. On the other hand, a trainee who drops out of an apprenticeship after the same length of time presents a considerable investment of time, talent and money to the company who was training him. The screening examinations, therefore, have become more and more stringent. This is particularly true in the electrical trade, and other apprenticeable occupations which require a higher degree of skill.

A major goal of this program was to match minority youth, Negroes in particular, with existing opportunities in the apprenticeable trades. All of the young men in the program were recruited from inner city schools. A continuing complaint on the part of employers has been lack of qualified Negro youth who could successfully compete in the written exams, interviews, background, etc. As an experimental and demonstration program, MYEP set out to demonstrate that it was possible to recruit, train, and place in apprenticeable occupations minority youth from the inner city.

The population to be served in this experimental program was located in the center of the inner city. The method of reaching the trainee was to go to the schools, and sell the program to those who qualified. The monetary inducements of entering the program meant a curtailment of immediate earnings. Because of the great demand for unskilled labor, most of the trainees could have secured employment in the automobile factories immediately upon graduation. However, if they accepted such employment, they would be underemployed and filling a job slot that could be filled by a person with less skill and ability.

In recruiting for this program and most of the special programs, the impact of social groups has had a negative affect. The delayed gratification concept is not a characteristic of lower socio-economic groups.

Many times trainees have been ridiculed by their peer group because they were earning a mere $20.00 a week while in training. The family has, in many cases, exerted pressure to have the trainee drop out of the program and "get a job." The fact that a trainee has no saleable skill and was unemployed when he came into the program is not a mitigating factor in this type of negative response because the economic conditions in the home are such that a job for $35.00 a week, no matter how temporary, appears to be superior to a training allowance of $20.00 a week even if it will lead to a well paying secure occupation.

Once a trainee is active in the program, there are many motivational devices built into the training to overcome these types of pressures. Suffice to say, the inability to delay immediate gratification of economic needs, both felt needs and real needs, poses a real problem in recruitment. MYEP has found that the most effective way to overcome this problem is to take the program to the prospective trainee and give a hard sell approach.

In the Pre-Apprentice group recruiting, the first contact was made at the school. The young men were assembled in an auditorium and given a hard sell on why this program deserved their careful consideration--the positive aspects and the negative aspects were both presented. Those who wanted additional information were then

asked to move to another room for a brief test, and additional orientation. This was a calculated risk. In moving to another room it was possible to lose the entire group. Conversely, if the young men followed us to the other room, they had psychologically committed themselves to the program. We lost two from a group of 26.

Formal intake was scheduled for the day after graduation. Again, it must be emphasized that this program could not have been successful without the cooperation of the Detroit Board of Education and MESC. The board representation, particularly Mr. Ernie Marshall, cooperated in every way possible. MESC sent a mobile team to ensure eligibility and to enroll the trainee at the project. While this was a departure from standard operating procedure, the experimental nature of the program warranted MESC's involvement in an experimental way also.

Each young man who committed himself to the program by going into the second room during the initial contact was serviced by MYEP. While all did not qualify for pre-apprentice training, arrangements were made to secure permanent full-time work for every trainee.

A. The Purpose of Training

The broad purpose of the training provided by the MYEP has been to enable socially, economically, and culturally disadvantaged youth to acquire the knowledge, skills, and attitudes necessary for obtaining meaningful entry level employment. While employment has been the goal of all the activities within the project, employment itself has been viewed in terms of its significance in enabling one to become a participating member of society and not as an end in itself. Therefore, although this section of the report will be concerned primarily with the training aspect of the Project, it should be remembered that all aspects of the Project (counseling, testing, job development and placement, medical services, grooming) have been vitally interconnected with the training and have provided a combined approach toward resolving the problems (personal, academic, occupational, and social) of disadvantaged youth. The total Project effort has been directed towards freeing the trainee from those elements which have hindered the achievement of success in the adult world; training has been one aspect of this effort.

In order to comprehend more adequately the interrelatedness of the various aspects of the program with training, the following will delineate the specific purposes of the different components within the project and will relate this with the overall purposes of training for employment and for life as an adult.

The specific purposes of the Project are designated as follows:

1. To counsel, test, and provide complete medical and dental examinations for incoming trainees, and to determine a plan of attack for each trainee on an individual basis. The findings in these three areas all impinge on the training aspect of the Project. Personal, social, and Medical problems of the trainee, if undiscovered or unsolved, greatly hinder the trainee in his development within the classroom and/or vestibule aspects of the program. Conversely, with the resolution of problems in these areas, trainees have developed much more rapidly in both the classroom and work experience components. Testing indicates the performance levels at which trainees enter the program and serves as a guide to their development during their participation in the program. It also helps to define the kind of training needed by each trainee to reach employable levels.
2. To provide special job training opportunities in an actual work situation that can be utilized by the trainee to acquire the work training and specific skills necessary to hold jobs in government and private industry.

This vestibule station aspect provides valuable information regarding supplemental training needed in a classroom context, as well as, contributing significantly to the total approach to training. A classroom or sheltered approach to training has deficits which can best be compensated for by combining it with a vestibule training station, just as a vestibule station of work experience alone cannot be adequate for providing needed skills or developing academic strengths. Vestibule stations also serve as an incentive for learning, since what is acquired in a classroom context is immediately put into practice in a work situation. Performance on a vestibule station is also some indication of how a trainee will perform on an actual job and, as such, indicates the decree of readiness for employment.

3. To provide related educational programs designed to complement on-the-job and vestibule training with related skills and, where needed, remediation in basic reading, verbal and arithmetic areas.
4. To develop new methods of testing and counseling in order to evaluate approximately the capacity of disadvantaged youth. Findings in these two areas supplement and modify the content of and approach to training.

5. To provide programs of selection that match youth with existing job opportunities and new job opportunities; and to stimulate motivation and facilitate successful work adjustment for them. The fact that all training is directly related to specific job opportunities and that trainee interest and aptitude are highly determinative of what kind of training they will receive, acts as a great motivational factor in the learning experience.

6. To provide a follow-up program for trainees once they have been terminated. A job clinic, testing, counseling and guidance are a few of the services provided in this area. The follow-up procedures also provide data on the success or failure of the training program and aid in adjusting the training program to reflect changes in employer requirements, as well as, to remedy deficits in previous programs.

B. Availability of Resources

The resources which have been available to the Project for conducting training programs have basically been the quality of the staff and the quality of the vestibule training stations.

The Project has consistently lacked those elements normally considered essential for the operation of an adequate training program--facilities, supplies, and equipment. During the past contract year, training programs were conducted in an elementary school no longer utilized by the Detroit Board of Education, and a small Lutheran elementary school no longer used by the church for its own educational program. Both schools were quite old and had been vacated by the previous educational agencies since they were inadequate for the agencies' purposes. The Project operated with three or four teachers for the entire year. There was little or no equipment available for conducting the classes--cooks, auto mechanics, pre-apprentices, police trainees, metal processors, retail sales, mechanical trades--and the nurse aide and clerical classes had a minimum of equipment, mostly obsolete. The major resource in the above areas was the vestibule station. While the Project lacked much in the way of equipment, this could be offset by a careful selection of vestibule stations. Here trainees were guided through various aspects of training by concerned supervisory personnel who exposed them to the kinds of training experiences and usages of equipment lacking within the Project itself. The manner in which this was done will be covered in the section describing the various kinds of training programs operated by the Project.

C. Methodology for the Determination of Areas of Training

A prime consideration in operating a successful training program is the selection of suitable areas for training. The types of training offered must be suitable for the population to be served, must reflect current needs in the job market, and must be in keeping with the training resources available to the Project (in terms of staff, facilities, equipment, etc.). Each of these factors were evaluated in terms of the other, and none were considered normative in themselves.

1. The Population to be Served

By contract the Project was committed to working with disadvantaged youth between the ages of 17 and 21. At the beginning of the contract year, there was a fairly equal distribution of males and females available for training; but as the year progressed, there were fewer and fewer males available because of two major factors--the war in Vietnam and increased need for unskilled males in factory occupations. Since a major factor in selecting areas for training was the characteristics of those who were available for training, the kinds of training offered by MYEP shifted to reflect the unemployed labor pool.

Initially, training was offered in areas suitable for males and females; as fewer males became available for training, more programs were offered for females. In the last months of the contract period, the trainee population was approximately 90% female since by that time there were virtually no males available.

Additional characteristics which determined the kinds of training to be offered were educational levels, occupational interests and the prior work experience possessed by unemployed youth.

After this analysis of the population to be served, the Project endeavored to design its programs for 17 to 21 year old disadvantaged youth performing below high school graduate norms who possessed some potential for meeting employer requirements. Courses would be of relatively short duration (in general, not to exceed six months) because of the orientation of this population towards crisis thinking and the immediate gratification of needs. Most of the potential trainees either had no prior work experience or worked sporadically in lower level occupations (car wash, domestics, etc.); hence, where possible, vestibule stations would be utilized.

While a need might exist for numerous employees in service categories (waiters, waitresses, bus boys, janitors, etc.), these occupations were not deemed suitable for the population under consideration because of the previous connotations of servility which surrounded these types of jobs.

2. The Job Market

What kinds of jobs were currently available and had some prospect of being available in the future job market? What were the requirements to enter these occupations? What jobs were available for the kind of population under consideration? How long would it take to train for these occupations? These questions and many similar ones required answers before a decision could be made on the levels of training which should be provided by the Project. The Occupational Outlook Handbook and similar publications provided information in these areas. The state employment services also conducted periodic analyses of the job situation in the Detroit area. However, we have found that in addition to these resources, a close contact with the industrial world is necessary for an adequate picture of employer

needs for specific occupations, in a specific area, for a specific period of time. The major element in deciding what kinds of training should be provided was based on what kinds of jobs would be available--and this was ultimately determined by direct contact with private employers. From them we obtained specific information of projected needs in various occupational fields, current and specific information on entry level requirements and suggestions both for areas of training and for the kind of training which should be provided.

3. Resources

The resources which were available to the Project were the third factor in determining what kinds of training would be provided. In many instances this factor was the desirous one. For example, analyses of employer shortages indicated the need for skilled automatic screw machine operators. In the population to be served, there were many individuals with the potential for employment in this field after adequate training. However, since we lacked both the necessary equipment and adequate facilities to house the equipment needed to train

automatic screw machine operators, the Project was not able to offer training in this area. There were numerous occupations in high demand in the Detroit area, but because of a lack of resources (teaching, personnel, equipment, facilities, or all these combined) the Project could not provide significant training to meet the needs of the job market for machine operators, key punch operators, data processors, etc. All three of the factors interacted with each other to determine the kinds of training which would be provided. In some areas, there might have been a need for a particular kind of training, and available resources; but the jobs were of a complexity beyond the achievable levels of the population to be served, or required unrealistic lengths of time to train individuals adequately (one to two years). In these instances the population to be served was determinative. In other cases, there were available resources to train in particular areas, but no particular <u>need</u> for this kind of employment in this job market. Here job market analyses were determinative. As has been cited, in other instances, lack of resources prohibited training in needed areas.

prohibited training in needed areas. Only when data in all three areas coincided (characteristics of the population to be served, the current job picture, and available resources) was training provided.

D. Constant Factors in the Training Process

In the past contract period the Project has offered training in ten different occupational areas. Each of these areas required a particular approach to training dictated, to a large extent, by the nature of the occupation, employer requirements, resources available to the Project and the characteristics of the trainees involved. However, in all of these programs there were certain factors that were present in the training process; and, in general, they applied uniformly to all groups. This section will confine itself to these constant factors, while Section E will discuss each type of training program individually (in terms of specific approaches to training, problems encountered, results, etc.).

1. The Orientation Period

Each incoming group of trainees participated initially in a one or two-week orientation program prior to beginning training in an occupational area. During this orientation period, various elements were included for all groups. Each received an introduction to the world of

work involving lectures, discussions, speakers, and films; these dealt with the nature of work in general, the resources for the necessity of work in our society, the manner in which work should be performed (in terms of work habits, attitude towards employers, fellow employees, etc.), and the rewards of work (financial, personal, social, etc.).

Initial Group Testing was also accomplished during the orientation period. This served as a guide to the training unit in determining the levels of achievement upon entrance into the program, the ability to perform in test situations, and the degree of punctuality to employer standards.

Initial Counseling Forms were completed as part of the orientation process, both to provide data for the counseling unit and to see initially the degree of proficiency possessed by the incoming trainees in completing forms. Each group was introduced to the Project staff, and a representative of each component in the Project explained the particular function of their department, and the manner in which the individual department fit into the overall approach of the Project in

training for employment.

A general explanation was given of the particular occupational category in which the new trainees would be receiving training, a broad description of the nature of the training to be received, the estimated length of time involved in the training program, the nature of the classroom work, and the function of vestibule or work stations in the training process.

An attempt was also made during the orientation period to communicate both the philosophy of the Project in dealing with the training of disadvantaged youth and the past history of the Project (in terms of origin, funding, successes and failures).

The orientation period served as an introduction to the training period and as a bridge between the previous existence of the trainees and entrance into the training segment.

2. <u>Testing</u>

In addition to the initial experience with testing during the orientation period, all trainees received (or endured) a considerable amount of "test taking" during the training process. This has been an essential component in the Project, not only for

the test data which has been obtained, but as a training factor itself. Testing is utilized to assess the degree of trainee progress in academic areas and the degree of relationship to employer norms (in those cases where testing is a factor in securing a job). Testing on standard employer test batteries has proved to be a valuable tool in evaluating the content of the material presented in the training component in terms of its relevance to employer requirements. As such, testing has constituted an element in the shaping of curricula.

Great care is used to avoid invalidation of standardized tests; it is assumed that employer tests are used to determine the possession of particular kinds of knowledge which are essential to successful performance in a specific job. The goal of the training unit has been to provide the types of information which employers have found to be essential for job success.

It is insufficient to offer training on tests themselves, since this will only equip an individual to pass a test; it will not prepare him for the demands of the job itself.

The fact that most tests may be culturally biased or culturally contaminated is irrelevant from a training standpoint. The aim of the Project is to prepare disadvantaged youth for life in what, unfortunately, is a culturally biased world, or at best, a culturally different one. While other Project efforts are directed towards altering the view of the advantaged world (including employers) toward the disadvantaged, the task of the training unit is to prepare youth for the world as it is. At least for the present, they will have to face culturally biased tests; they must receive, therefore, the type of instruction which will enable them to function in both, test and work situations. A significant part of the needs of the disadvantaged is the provision of a wider range of experiences, experiences which are often gained by a non-disadvantaged population in the normal course of its existence.

The testing aim of the Project serves an additional function as a training supplement by providing much needed experience in test taking per se. It may be true that test taking does not significantly alter results for a non-disadvantaged, middle class,

verbally-oriented population. However, with a disadvantaged population, familiarity with tests and test taking procedures does affect the results. Therefore, the testing department is utilized in this manner as part of the training process.

3. Occupational Grouping of Trainees

Trainees in the Project are not grouped on the basis of their educational characteristics or on the findings derived from achievement and/or aptitude test batteries. Levels of proficiency in the usage of English; knowledge of grammar, spelling, vocabulary, arithmetic; typing speeds; previous work experience, etc.--none of these plays a significant part in the assignment of a trainee to a particular training class. Trainees are recruited and referred by other agencies (MESC, NYC, etc.) for specific occupational training and are assigned to classes on the basis of common occupational objectives. The main determining factors in the assignment to a particular occupational training program are an interest in the job area, and some indication of a potential to develop the necessary skills for employment in the designated field.

During the course of the training, it might be discovered that an individual no longer possesses an interest in the initial occupational area, or that he might not be able to acquire the requisite knowledge and skills to obtain employment in an occupational area for which there is still a high degree of interest. Only if the trainee is in agreement is a change of training area made, and the desires of the trainee are the primary consideration. Findings of the various Project components (counseling, testing, teaching, etc.) may indicate that a change in occupational preference is warranted; there may be a staff consensus that a trainee has set an inappropriate occupational goal. This information would then be presented to the trainee--but only if the trainee is in agreement with staff findings, is a change made. If the trainee still desires to work toward an occupational goal which the staff might feel is unrealistic, the trainee will continue in the area of his/her preference.

In other instances the request to change training programs has originated from the trainee. Sometimes this is due to a feeling of discouragement

about the possibilities of achieving the initial goal; sometimes because of a change of interest due to exposure to a variety of possible job opportunities and the resultant acquisition of a new interest. If the staff concurred in the trainee's self evaluation, a transfer to another occupational training program would be made immediately. On occasion, the staff has felt that the trainee's original choice was realistic and achievable; and they would suggest continuing in the initial training category. However, trainee reaction would again be determinative. If the individual felt that, in opposition to staff recommendations, he would like to try a new area, a transfer was made.

Occupational grouping of trainees has both definite benefits and definite drawbacks. As an example of the latter, a clerical training class might have members whose verbal skills range from 3rd grade to 12th grade levels. This can create various problems in terms of the curricula to be used, rates of progress, interest levels, etc. However, we have found that the benefits derived from occupational (as opposed to academic) groupings outweigh the defects.

Common job goals act as a strong motivating factor in the learning experience of a group. Often more advanced trainees have been used to assist slower trainees. This, in turn, has aided in the development of both groups.

Basic education, as such, has not been provided by the Project. What basic education has been provided has been directed toward meeting individual needs for specific skills or knowledge required for specific employment; and this has been provided in conjunction with occupational training.

4. Pedagogical Philosophy

There has been no single pedagogical technique utilized by the Project teaching staff to accomplish its instructional goals; nor has there been any definite conclusions regarding the use of programmed materials and teaching machines as approved to or in conjunction with the lecture-discussion technique. This absence of findings in what is traditionally considered the essentials of a teaching program should not be taken to indicate that there wasn't an educational development of the trainees; nor a particular approach to the problems of educating disadvantaged youth.

Underlying all of the teaching activities was a certain philosophy regarding the needs of the disadvantaged, the role of a teacher and the educational process. In addition, there were certain common factors built into each training class which constituted a tacit, if not always explicit, pedagogical approach.

A major element in the pedagogical philosophy of the Project was an attitude toward the trainee; a view regarding the reasons why he was disadvantaged, and why he was in need of further educational training beyond that provided by the traditional educational institutions.

The Project was committed to working with youth who were unable to make a successful transition from school to work. Hence, the population which the Project served were automatically those individuals who had already experienced a large degree of failure. Failure often pervaded every aspect of life--personal, social, academic, occupational. The first assumption of the Project staff was that our trainees had the capabilities to succeed; that they were not failures inevitably and permanently but that they had experiences of failure. The task, therefore, of the teaching

staff was to develop a pattern of success--perhaps in minor areas initially, perhaps not earth-shaking successes--but real successes, nevertheless. Teachers attempted to present materials on a level where the initial experiences of the trainees would be successful ones.

Much of the failure-complex characteristic of the trainee was acquired in a school situation. What was often wrong with the school setting was not necessarily the materials presented nor the techniques used in teaching. Inevitably, there were overcrowded classrooms, lack of personal relationships with school personnel, no apparent relevancy between the subject matter of the classroom and the exigencies and demands of daily life--no reason for learning because of no definite, reliable goals. The Project sought to overcome this by various approaches.

Classroom ratios between teacher and pupil never exceeded a 1 to 20 norm. Trainees progressed at their own rates of development and when they were ready for employment, they were placed on jobs. This invariably reduced the ratio between teacher and trainee since no attempt was made to keep 20

trainees in a class at all times. This allowed the teacher to spend more time with the remaining trainees, who in turn, needed more individualized work.

The relevancy of materials presented in the classroom setting to obtain employment was always indicated either directly or indirectly. Hence, trainees realized that what they were attempting to learn had a direct relationship to an immediate attainable goal. This acted as a high motivational factor for obvious reasons. For example, it is one thing to learn English because it is a school requirement for graduation; but it is a far different thing when it is a pre-requisite for obtaining employment in a clerical occupation. This is especially true if a person has been unemployed for a period of time and has had repeated failures in job seeking activities, often due to educational deficiencies.

The degree of success which each individual instructor had with a particular class was not dependent so much on the information he was able to communicate or the techniques used, but on the degree to which he was able to establish a good relationship with the trainees.

Again, the assumption of Project personnel was that the trainees had not failed because they lacked intelligence, ability, motivation, etc. Life experiences had so affected their self-concepts, their image of other people, the goals they had set or failed to set, that they were unable to learn and would continue to be unable to learn unless new experiences affected these factors. The teacher saw his role as one of liberating the trainee from a given view of himself and his surroundings--liberating him so that he might achieve in ways commensurate with his real abilities and potentialities. The teaching process was not viewed primarily as one of communicating information, but in terms of effecting the attitudes of trainees so that learning would be a possibility for them. Trainees learned facts, materials, skills, etc., and this was a crucial factor in obtaining a job; but little learning could have taken place if the staff had not been able to effect trainee self-concepts and attitudes, or if a climate which encouraged learning had not been created.

Instructors were encouraged to present materials and to conduct the classroom in ways consistent with their own personality structures. Some were more permissive, some more authoritarian. There was no demonstrable correlation between success in communicating and other of these attitudes. If trainees sensed that an instructor was basically for them, interested in them as persons, and believed in their ability to succeed, they responded to almost any kind of approach to teaching and differing personality types. Hence, the more permissive and the more authoritarian instructor had an equal distribution of successes and failures.

While the general tenor of the Project was more permissive and accepting, it was also recognized that trainees required a certain degree of structure and some setting of limits. This was provided by various personnel, both within the classroom and through contact with other Project components.

An underlying approach also provided the development of curricula for all occupational groups. Whatever particular techniques were used, whatever kinds of materials, whatever the personality structure of the teacher might be, one element was constant. Trainees would be taught those things necessary for obtaining employment. In terms of the development of the occupational content for the various programs, the current requirements of employers for particular job categories was the determining factor. Through contact with employers the Project could determine what employers desired in an employee as to skills, knowledge, personal attitudes, etc.--and this is what

the trainee received. This process of matching classroom work with employer requirements was an ongoing one and classroom work was adjusted as needed to reflect adjustments in employer requirements. As a procedural approach, the Project assumed that for the most part employer requirements were realistic and in keeping with actual demands of a job category; therefore, the Project felt that it was its responsibility to elevate youth through training to meet existing employer requirements. The particular way in which this effected the curricula development for each occupational category will be spelled out in Section E.

Excursus 1. The Teacher-Coordinator Approach

In the first year of the Project's operation a particular approach to training was adopted in an attempt to deal with the multi-faceted problems of unemployed disadvantaged youth. A person designated as a work-education coordinator (WEC) was assigned to a group of 20 trainees. In general, the WEC was responsible for the total needs of this group. For one-half of a day, 5 days per week, the WEC worked with the trainees in a classroom setting and was responsible for the educational occupational development of the group. The other half of the day was spent in a number of activities connected with other aspects of the trainee's development. Part of this time was occupied in visiting the vestibule stations, discussing trainee progress with work station supervisors, observing the trainee in a work situation, and, when possible, speaking directly with the trainee about any number of things--work, personal problems,

family life, etc. Other time was spent by the WEC on visits to the trainee's home, discussion with parents, parole officer, ministers, and other types of involvement in the outside-the-project life of the trainee. WEC's went on field trips with their group to private industries, public facilities, cultural events, and picnics. This multiple function as teacher, coordinator, counselor, social worker, parent surrogate, and legal advisor, gave the Wec a unique relationship with the trainee--one which was of inestimable value in understanding and meeting the needs of the trainees.

In the current year of operation, it was felt by the Detroit Board of Education that only four teachers could be provided for the Project, and that they would be required to operate strictly in a full-time teaching capacity. Teachers would teach full time and would confine their activities almost exclusively to a classroom context. The Project, therefore, provided co-ordinators who would be responsible for the activities formerly performed by the WEC's outside of the classroom--visiting of vestibule stations, home calls, counseling, field trips, etc. Teachers continued to handle only 20 trainees at any given time in the classroom, but had 2 groups of 20 which they taught each day for 5 days per week. One coordinator was assigned to 40 trainees.

In comparing the two approaches, the Project staff unequivocally felt that the role of the WEC was much more effective in dealing with the total needs (educational, social, personal, and occupational)

of the trainee. The WEC provided a confined approach to all levels of the trainee existence; the bifurcating of this function into a teacher and a coordinator led to many of the problems characteristic of the educational institutions in which the trainees had already had many experiences of failure. One person taught; another counseled; another visited the home, etc. Teachers who must teach all day have little time or energy to expend resolving personal problems of the individual student and often are unaware of the existence of these problems. The Project was aware at the outset of problems which could develop by dividing the functions of the WEC among two staff members, teacher and coordinator and worked at reducing these. Teachers and coordinators were to work as closely as possible with each other in terms of servicing the trainee population. Knowledge obtained about the trainee by one was to be communicated to the other. Both were to be involved in the resolution of trainee difficulties, one in a classroom context, and the other outside the classroom. As much as possible, the teacher and the coordinator were to function as one person, and the measure of success achieved by this approach was directly related to how closely this unity was realized. The Project found that the teacher-coordinator approach could be effective in the training process, but required constant effort to avoid breakdown in communication to encourage a sharing of information about trainees and to plan a unified approach in dealing with the trainees. As a necessity brought about by inter-agency differences,

this approach could be made to work; the ideal approach, however, is still felt to be that developed by the work-education coordinator.

5. Physical Remediation: Its relationship to training and employment

A fifth common factor in the training process was the provision of medical services to resolve existing health problems. All trainees were given an initial diagnostic medical examination; an attempt was then made to correct the medical problems discovered by this examination.

The physical problems of a disadvantaged population are the result of a lifetime process of various factors: improper diet, poor living conditions, lack of knowledge, inadequate funds to correct physical deficiencies, and inadequate public facilities for providing free medical correction. However, an individual's physical condition has a direct bearing on the acquisition of training and the ability both to obtain work and to keep working. The Project discovered early in its development that an attempt must be made to resolve these physical problems in order to make it possible for the individual to obtain training and eventually go to work. Poor eyesight, partial or total loss of hearing, anemia, pain caused by dental defects, insomnia, severe hemorrhoids--these and a myriad of other physical problems make it all but impossible for an individual to gain anything significant from occupational training or an educational process. Even if an individual is able to learn while plagued by a host of physical problems; he has little opportunity of gaining

employment or holding it for any length of time. Physical remediation, therefore, was regarded by the Project as an essential component in the training process, along with educational remediation and skills development; often it was the medical services that made the acquisition of the latter a possibility.

The manner in which medical services were made available to the trainees also reinforced another goal of the training process: the development of a sense of personal worth. The experience of a disadvantaged population with public health agencies is often a frustrating, and occasionally, a degrading one. Many public health facilities are often in poor physical condition, inevitably overcrowded, and have long working periods for services. It is not uncommon for a person in need of medical help to wait two to four hours for an initial appointment, another two hours for an examination, and lengthy periods of time for subsequent visits. (This is by no means exclusively the fault of the public health facilities which are understaffed, overworked, and often poorly equipped. Failure to correct this situation does reflect on a society unconcerned about the needs of the poor and the importance of resolving them in a more humanized, personalized manner.) All of this is very discouraging for the poor individual, plays a part in the failure of the disadvantaged to obtain needed medical services, and reinforces the disadvantaged person's image of himself as one who is not worth much, deserves no better, is unsignificant.

The Project felt that in its medical program, as well as in its other aspects, the trainee should be treated as someone of value, someone entitled to the same care and consideration as the "advantaged" population. Therefore, the medical services which were provided were done with this in view. Individual appointments were made at private hospital clinics, waiting periods were reduced, and a high degree of personal attention was given to the individual's problems and their resolution.

Resolution of physical problems not only had a direct effect on enabling the trainee to acquire training, but served indirectly to reinforce the other project efforts to create a sense of worth in the trainee's view of himself.

6. Counseling and its Relationship to Training

Physical problems act as a deterrent to learning and to work; this is equally true of emotional and personal problems. Initial counseling contacts were made with all incoming trainees; further services were provided on a "as needed" basis and played a significant part in the training process. Our findings showed that physical defects retard or prevent learning and work. An attempt was made to correct these feelings of insecurity, poor family relationships, neurotic fears, and the full range of psychological and social problems present in the individual trainee retarded or prevented the training process and the acquisition and retention of a job.

Intensive counseling might be needed to free an individual so that learning was a possibility for him, or to reduce anxieties prior to a job application. While the Project had a counseling staff, the counseling function was not limited to them; it was shared by various staff members, in formal and informal fashions, in the classroom and out, on stairways, in cars, in groups and individually. (For a more complete elaboration of the counseling function per se, and in its relation to training see Section V of the report.)

7. Job Application Procedures

The overall goal of each training program was to prepare youth for employment through education, skills development and supportive services. One of the latter which was real of the training process was related directly to the trainee's contact with the employer. Just and specific training was provided to remedy educational and occupational deficiencies, so specific training was given in job application procedures.

Trainees were given practice on completing application forms. These were provided for Project use by Civil Service Agencies and private employers. Work in this area involved information regarding application forms, terminology employed, definition of words, the value of a well filled out neat-appearing application in terms of its effect on the potential employer, and assistance in obtaining data required for completion of the forms (references, birth certificates, social security numbers, etc.).

Trainees were also taught to have with them at all times a 3 by 5 card with the relevant information needed to complete forms accurately and completely (dates of employment or training, schools attended and dates of attendance, names and addresses of references, etc.) This card was found to be of great value to trainees when they actually went out on a job interview. It released them from some anxiety, allowed them to concentrate on neat completion of the form (since the information required did not have to be recalled from memory) and prepared them more adequately for the oral interview.

Information was also provided on interview techniques. Lectures and discussions were given analyzing the attitudes of employers and hiring personnel toward minority groups, the information sought through the oral interview (factual data and personality components of the interviewee) and ways of presenting oneself in the best possible light (how to enter an office, how to talk, kinds of questions to ask and to avoid asking, how to start and conclude an interview, approximate apparel for the interview, etc.). Much of this material was covered, more indirectly through mock interviews conducted in the classroom, in which one individual played the part of an employer and a trainee played the part of a job applicant. The role of the employer was shared by various people: the classroom teacher or coordinator (staff members with whom trainees were quite familiar), the job placement staff (not well known to the trainee) and the trainees themselves.

The class was responsible for evaluating the performance of each trainee in his role as job applicant. In addition to serving a valuable function by giving practice, the mock interview (often extremely humorous) acted as a tension reducing device and, thus, played a constructive part in alleviating anxiety about an actual job interview.

Trainees were given some instruction in how to look for jobs: what agencies to contact, the comparativeness of private and public employment agencies, want ad searching, civil service notifications, the value of recontacting employers; how to handle the "we'll call you" routine, etc.

Teachers, coordinators, counselors, job placement staff and outside resource people were utilized to deal with various areas including personal hygiene, grooming, and appropriate dress for the employment interview and the job itself. Work was done in this area on an individual and a group level.

E. Description of Individual Training Programs

The Project operated eleven different types of training programs in the past contract year. Since each had its own requirements, (objectives, selection criteria, results, etc.) they will be dealt with on an individual basis. This section will confine itself to the way in which each specific program operated. It should be understood, however, that the constant factors discussed in Section D

were present in all of the following programs; the description will be concerned only with the training process directly, the preparation for it, and the results achieved.

The following table gives a composite picture of the various types of training programs in terms of a numerical analysis of the trainees and the results achieved. Only 8 of the 11 programs are included; the 3 programs not included were operated after normal project hours, involved adults, and differed from the regular programs in various aspects. They will be discussed separately.

Training Program	Enrolled	Terminated	Employed	Training Related Employment	School	Military	Neutral	Negative	Unplaced
1. Clerk-Typist									
MDTA	133	127	87	77	9		16	6	9

Explanation of Terminology Employed

"MDTA" and "NYC" refer to the manner in which trainees were paid for their participation in the training. A different training approach was required for individuals enrolled under those categories and this will be discussed under each occupational analysis.

The Items: "employed, school, military, neutral, negative, and unplaced" are a breakdown of the total terminations into type of termination. The first three are self-explanatory: "neutral terminations" refer to individuals who were forced to leave the program because of illness, pregnancy, family problems, relocation, incarceration. "negative termination" refer to those individuals who left the program because of lack of interest. In the case of NYC enrollees this meant that they were terminated from the MYEP phase although they continued with NYC. "Unplaced" refers to these trainees who completed the training program but were not placed on jobs. Positive terminations are the total of job placements, entry into military service or school.

(It should also be noted that there are fewer terminations than enrollment. Trainees who were not terminated by July 1, 1966, are still involved in training at the Project under the new contract period.)

1. Clerk-Typist Training Program

	Enrolled	Terminated	Employed	Training Related Employment	School	Neutral	Negative	Unplaced
MDTA	133	127	87	77	9	16	6	9
NYC	126	45	23	22	4	3	15	
Total	259	172	110	99	13	19	21	9

	MDTA	NYC	Total
Positive Terminations (Employment - School)	75.6%	60%	71.5%
Negative Terminations (Lack of Interest)	4.5%	11%	8.1%

Trainee Selection Criteria:

Age: 17 to 21
Sex: Female
Grade Level: High School Graduation

Training Data

Approach: classroom and vestibule station
Estimated length of training: six months

The clerk-typist training program contained the largest number of trainees in the Project. The reasons for offering training in this occupational field were many. First, an analysis of the needs of employers in the Detroit area indicated an increasing demand for females in various clerical capacities, at the present time and in the future. Jobs in the clerical field also would provide continuous work with virtually no lay-off and little chance for automation to significantly reduce the need for clerical personnel. Once entry-level employment is obtained in this capacity, there are good opportunities for upward-mobility, as well as job security. The second determinative factor was the occupational interests of the unemployed female disadvantaged population.

There was a steady pool of unemployed 17-21 year old females whose primary occupational interest was in clerical jobs. Some of these young women had taken commercial courses in high school but did not possess the typing skills or verbal proficiency needed to meet existing employer standards. Others had had a college prep curriculum; but because of poor marks, inability to meet college entrance requirements, financial needs or a change of interest, had not continued their education on the college level, and subsequently found themselves ill-equipped to obtain employment. Still others had made no definite plans for post high school life, had usually taken a general curriculum with some typing and also found that they lacked the skills needed to obtain employment. The third factor which conditioned the Project's thinking regarding the feasibility of training in clerical occupations was the resources available to this Project. Instructors could be obtained who could teach the necessary communication skills, typing, office practice, business arithmetic, etc. Vestibule stations could be developed in city departments which would provide meaningful training experiences in actual work situations. There would be an opportunity, at those stations, to develop both occupational skills (typing, filing, operating business machines, answering phones, etc.) and personal qualities desirable for a clerical employee.

The particular approach to training was conditioned in part by the manner in which trainees were reimbursed for participation in the program. Individuals receiving MDTA training allowances

followed a different training schedule than that utilized for Neighborhood Youth Corps enrollees. In the former instance, trainees were present in class for one-half of a day and spent the remaining half at a vestibule training station. This schedule was followed for five days a week. NYC trainees worked three full days a week, and were involved in the training program for 2 days. Of the two approaches, the one utilized with MDTA trainees appeared to be more fruitful from a training standpoint. The five half days in class permitted a continuous instructional presentation and also gave project staff daily contact with the trainees. Conversely, with the NYC trainees, there was an interruption of five days in the educational process due to the three full days work schedule and weekends. It further appeared that 3 or 4 hours per day of classroom instruction 5 days a week was more suitable to the needs of a disadvantaged population than 2 seven or eight hour days (because of attention shown, retention of material, reinforced learning experiences, etc.).

The curricula utilized in training clerk-typists was based entirely on information fed back to the Project from the placement staff's contacts with employers. A combination of factors was required almost uniformly by all employers as a prerequisite for employment in clerical capacities. Typing speeds had to approximate 50 words per minute. Academic skills in English (vocabulary, grammar, spelling, punctuation) and in arithmetic had to be developed sufficiently both for passing clerical screening tests and successful

performance in the job situation. Trainees in this occupational category spent their classroom time equally, divided between work in improving their typing, and academic work in the above mentioned areas. The content of the academic component was not general or remedial in nature, but was linked with the needs of the occupational category. In the communication skills areas vocabulary, grammar, spelling, and punctuation were handled in terms of their applicability to a clerical situation. Arithmetic was taught in terms of its relationship to the occupational field (rates of interest, bills of lading, numerical sequences for filing procedures, etc.). In a large measure the curricula was developed in terms of areas and content found in the Arco test books for clerical occupations. The typing component also provided instruction in office procedures and general clerical skills (filing systems, telephone procedures, office decorum, etc.).

In addition to the development of skills, the project staff had to deal with another crucial factor in the preparation of clerical trainees for employment. In order to obtain a job in a clerical capacity, trainees were required by employers to pass tests in both typing and academic areas. The levels of qualification were not unrealistically high, and often trainees performed at equal or greater levels both in the Project and vestibule stations. However, when trainees were tested at the various industries, their performance was often considerably below that achieved in the relatively stress-free environment of the training programs.

Extreme nervousness, lack of confidence, fear of failure, insecurity in the confrontation with the potential employer all contributed to poor performance in test situations. For example, girls who could type 50 words per minute in the project environment would often lose speed and increase the number of errors made in a test situation at an employer's facility. The Project built in a stress situation in its training component to acclimate the trainees to the type of situation they would face during an actual job seeking situation.

Various factors entered into the determination of the trainee's readiness for job referrals. Proximity to employer norms was the key measure device and this was measured by performance in both the practical (typing) and academic portions of the programs. Skill development and work attitudes were determined primarily by performance at the vestibule training situation through the evaluation of the work training supervisor and the co-ordinator. Only when the various project components (instruction, testing, placement, counseling, co-ordinators, etc.) concurred, was an individual considered ready for job placement.

While the ideal was to develop the individual in both typing and academic areas, it was found that some trainees were at employable levels in many capacities but fell short of employable levels in others. For example, a trainee might be typing at 50 to 60

words per minute but did not demonstrate an ability to perform in an academic test situation. Job referrals were then made to these employers who used typing tests as the sole or primary resource of employability. If an individual performed well in a test situation but was weak in typing, referrals were made to those employers whose hiring practices were determined primarily or exclusively by performance on clerical test batteries.

The positive terminations (employment and school) were significantly higher for MDTA trainees (75.6%) than for NYC enrollees (60%). Similarly there were fewer negative terminations for MDTA trainees (4.5%) than there were for NYC enrollees (11.9%). This can be accounted for by various factors: MDTA trainees were totally involved in Project activities and this received the full benefit of total staff resources. MDTA trainees were serviced by one agency, while NYC enrollees were involved with numerous agencies (MESC, NYC, MYEP), each of which had one or more functions with the trainees; allowances for MDTA trainees were handled by MYEP staff and were given for participation in a training program. NYC trainees were paid by NYC for hours worked and participated in MYEP on a voluntary basis.

The length of time which it took for a clerical trainee to obtain sufficient training to secure a job varied with the individual. The following analysis gives an indication of the distribution of trainees in terms of the length of time spent in the program before obtaining employment. The trainees considered are those who were terminated for employment reasons only.

Months in training	MDTA Trainees	NYC Trainees
1	10	11
2	8	3
3	7	8
4	7	1
5	8	
6	4	
7	8	
8	9	
9	6	
10	8	
11	5	
12	7	
	87	23
Average length of training	6.2 months	1.9 months

The average length of time spent in training before acquiring a job for a MDTA trainee was 6.2 months. However, the average in that case, as in others, is somewhat misleading. What is more significant is the pattern of random distribution or rather the lack of the normal distribution one might expect. MDTA trainees were fairly uniformly spread out over a 12 month period in terms of the length of time needed to obtain a job. The only conclusion that can be drawn from this data is that an individual's rate of progress in the project was to a large extent conditioned by her background and levels of achievement prior to entrance into the program. Each trainee was allowed to develop at her own rate; those who were nearer

employer norms when they entered the program obtained jobs sooner than those who needed more intensive work. As an individual reached employable levels she was referred for a job. If the distribution indicates anything significant it is that development of skills in an individual is based on what background the trainee had prior to entering the program.

In the case of the NYC clerical trainees, all placement occurred within four months after entering the program. It is significant that there were an equal number of negative terminations during this same four-month period for NYC clerical trainees. It appears that the NYC population and the structure under which the coupling program was initially operated, there was little possibility of retention of trainees for any length of time. Either the trainees were placed rapidly or they lost interest, dropped out of the WEP phase and then continued in their NYC work experience alone. MDTA trainees could be retained in the program until such time as they were ready for employment; half of the MDTA trainees, it should be noted, did not obtain employment until they had been in training between six and twelve months.

2. Metal Processor Training Program

	Enrolled	Terminated	Employed	Training Related Emp.	School	Military
MDTA	165	165	120	90	13	3
NYC	22	20	1			
	187	185	121	90	13	3

	Neutral	Negative	Unempl.
MDTA	10	17	2

NYC	10	19 36	2

	MDTA	NYC	Total
Positive Terminations: (Employed-School-Military)	82.4%	5%	74%
Negative Terminations: (lack of interest)	10.3%	86.4%	19.2%

Trainee Selection Criteria:

Age: 18 to 21
Sex: Male
Grade Level: none required, 9th grade preferred
Special Skills: none; no obvious disabling handicaps.

Training Data:

Approach: Classroom only
Estimated length of training: Three months

The metal processor training program was developed in conjunction with the largest steel manufacturing company in the Detroit area. The personnel director of the company indicated that he had difficulty filling job vacancies and meeting new hiring needs (which sometimes amounted to fifty men per day). The main requirement for employment with the company was the knowledge of arithmetic on the sixth, seventh, and eighth grade levels, and the ability to pass an examination which tested for this knowledge. This appeared to be the major obstacle in obtaining employees. The company also administered a very thorough physical examination, and this, too, excluded many individuals from employment. Discussions with the personnel director led project staff to feel that the screening devices were reasonable, were not being used arbitrarily to screen out job seekers, and were realistic in terms of the demands of the work. The company had a policy of promoting employees from the laborer category into any number of skilled and/or semi-skilled operations. No further exam-

ination was required for this promotional movement, but employees did need a basic knowledge of arithmetic to operate productively in these skilled/semi-skilled capacities, and as a base upon which to build increased knowledge and skills. Therefore, every individual who entered the company was required to demonstrate knowledge of arithmetic in order to guarantee a minimal base of information for job mobility. (It should be noted that the realistic possibility of movement into semi-skilled or skilled capacities in relatively short periods of time was the main factor in deciding to train in this area. The project had avoided training and/or job referrals for unskilled jobs in a factory complex, since these were regarded as dead-end jobs, many of which would soon become obsolete. The steel company's practice of promotion from within was in keeping with the project's goal of training for entry-level employment in areas where these were possibilities for upward mobility. The physical examinations were thorough because of many health problems peculiar to the steel industry. For example, the company found that dead teeth were a serious hazard to health in the steel industry; if the tooth became infected, the infection could travel to the eye and cause blindness. Similarly, other physical disabilities precluded work in certain areas of the industry e.g. around smelting ovens.

The program that was developed by the project was directed simultaneously, meeting employer requirements and serving the needs of the disadvantaged population. After a two-week orientation period, trainees began classroom work five days per week basically in arithmetic remediation, but specifically directed at the needs of this particular steel company. This included work in addition, subtraction,

multiplication, division, conversion of fractions to decimals to fractions, knowledge and use of the steel ruler, the cast for lengths of steel, cubic measurement, etc. No vestibule stations were provided, since no work stations could be found in city departments which would duplicate the kind of work situation at the steel company. We tried to utilize some general labor vestibule stations for trainees in this category, but this did not prove effective since they were unrelated to the occupational field. Work attitudes, employer-employee relationships, punctuality and attendance, etc., were handled through classroom lectures, discussions, and films. On several occassions, former trainees who had secured employment at the steel company spoke to the training class about the work situation, hours, pay rate, and company policies.

Particular attention was paid to the medical needs of trainees in this occupational training program. The Project was aware of their physical defects which would preclude employment with the steel company and sought to correct them. Dental work (particularly extraction of dead teeth), minor operations (for hernias), special medication, etc., were some of the kinds of services provided for trainees in this category.

Trainee readiness for employment was determined in two ways: proximity to employer standards in knowledge of arithmetic; and resolution of physical and personal problems which might impede initial employment or prevent continuous employment. The decision on trainee readiness was reached through consultation with the various staff components (teaching, counseling, testing and coordinators).

The following analysis will give an indication of how long it took trainees in the metal processing program to obtain employment. The table indicates how many trainees obtained employment after one month of training, two months, etc.

Months in Training	Trainees
1	33
2	39
3	22
4	15
5	8
6	1
7	1
8	1
	120

Average length in training: 2.5 months

The average length of time spent by an individual in metal processor training was 2.5 months. The length of time which it took to develop the necessary knowledge to obtain employment depended to a large extent on individual data of progress. As a trainee demonstrated proficiency in arithmetic, and personal and medical problems were disolved, he was referred for employment. Essentially the academic deficiencies of the metal processor trainees were resolved in the first three months. The bulk of trainees who obtained employment after three months were those who required more intensive physical remediation, or resolution of personal ans social problems (both of which interfered with the learning process and/or the obtaining of employment).

Seventy-five per cent (75%) of the trainees who obtained employment were placed in training-related occupations; the other 25% were placed in nontraining related jobs. The latter occurred for a variety

of reasons. Some individuals did not want to continue in training when jobs were available in factories on an unskilled level. Although attempts were made by the project staff to defer youth from seeking jobs of this mature, a number of trainees went to work in factories rather than persist in a training program. In some instances they were aided by project staff in securing such employment; more often they obtained these jobs on their own. Other youth showed little progress in acquiring the necessary knowledge for employment in the steel company, and were placed in jobs more commensurate with their abilities. In a few instances, trainees discovered that they were not interested in employment in the steel industry and had potential for higher levels of employment. These were aided by Project staff (educational, testing, and job placement) to enter directly into skilled occupations with various industries (the gas company, the telephone company, etc.).

There was a total of 22 NYC trainees who were involved in this training program. They continued on NYC work stations for 3 days per week, and were expected to attend AYEP class for 2 days per week. This proved to be a very unsuccessful venture. Of the initial 22 trainees, 19 dropped out of the program within the first 2 weeks. The NYC trainees showed little interest in being sent to the program, apparently found little to interest them in their 3 to 4 days in the project; and since their participation was on a voluntary basis, they just stopped coming. They did continue with their NYC work experience after leaving MYEP. Because of a shortage of male enrollees in NYC, we have not been able to initiate another program with males from NYC.

Part of the problem may have been that these trainees were among the first sent by NYC to MYEP; liason between the two agencies was not well developed and there was a lack of communication regarding the problems of these particular NYC enrollees.

3. Nurse Aide Training Program

	Enrolled	Terminated	Employed	Training Related Employed	School	Neutral	Negative	Unplaced
MDTA	79	79	60	59	2	13	3	1
NYC	92	38	24	24	0	2	7	5

	MDTA	NYC	Total
Positive Terminations (School - Employed)	78.5%	63.1%	73.5%
Negative Terminations (Lack of interest)	3.8%	7.6%	5.8%

Trainee Selection Criteria:

Age: 17 to 21
Sex: Female
Grade Level: none required; some high school preferred

Training Data:

Approach: classroom and vestibule station
Estimated length of training: three months

The conjunction of factors which was present in the decision of the Project to train in other occupational areas was also present in the considerations for a nurse aide training program. With the increase of health services, hospitals found themselves in need of the full range of medical personnel; this included nurse aides. The normal procedure utilized by hospitals in obtaining nurse aides, when exper-

ienced employees are not available, is to hire inexperienced women who have some interest in working in a hospital situation; these individuals are then put through a training program at the hospital lasting from two to four weeks based on the individual policies of the particular institution. The Project felt that it could aid the employer by providing individuals who had some training and experience in the nurse aide field. We realized that the hospitals subsequently would provide their customary training period for new employees; but our trainees would possess some basic knowledge and experience that would also make it easier for disadvantaged youth to obtain and retain employment.

Another consideration in deciding to provide nurse aide training was the characteristics of unemployed females. Many lacked the aptitudes and interests for employment in clerical capacities; others expressly indicated a desire to enter the nurse aide field but had found it difficult to do so. Still others hoped to make nursing a career; they desired nurse aide employment as a means of obtaining funds to forward their desires, and as a way of gaining their first exposure to an area related to their long-range occupational goals.

The Project also felt that its resources were sufficient to offer adequate training in this field. A registered nurse was acquired to handle the training program in a classroom context. Equipment was obtained to establish a mock hospital situation. City hospitals were contacted, and they agreed to enter into a training relationship with/ or by providing meaningful work-training experience in an actual

hospital context. Vestibule stations were developed with these hospitals in which trainees would be exposed to a variety of nurses-aide functions under adequate supervision and in a scheduled fashion. The vestibule station experience and the materials presented in a classroom mock-hospital situation were closely interrelated; one element supplemented and complemented the other.

The hospital vestibule station component was found to be a highly desirable, if not inexpendable, element in the training process. The Project attempted to operate one nurse aide training program with NYC trainees who remained on former NYC work stations which were unrelated to the nurse aide field. While the classroom training in the nurse aide area was adequate, it could not be substituted for the learning experience gained through hospital vestibule stations. Even where sufficient knowledge was acquired through the classroom situations, employers were loathe to hire individuals who had no hospital floor experience. After this initial experience, subsequent nurse aide training programs were set up with a vestibule station experience in a hospital.

The following will give some indication of the manner in which this combined approach (classroom and vestibule station) operated in the training of nurse aides. It should be noted that the hospital component was not solely a <u>work</u> experience but a well-regulated <u>training</u> experience as well. The total nurse aide training program resulted from combined planning involving both hospital and Project staff. The hospital experience involved rotation through various departments within the hospital and a systematic exposure to various routines within these departments.

Hospital Work-Training Component

Contagious Diseases: 96 hours. General duties include bed baths, bed-making, taking temperature, pulse and respiration; transferring patients to wheel chair, stretcher or chair; administering the cleaning of bedpans, emesis basing; feeding patients; cleaning bedside units, linen rooms, etc.

Central Supply: 48 hours. Duties include cleaning glove, thermometers, syringes; removing sterile supplies from autoclave; folding gowns and other linens.

Pediatrics: 96 hours. Duties include diapering infants; taking rectal temperatures; feeding and bathing infants and children.

TOTAL 240 Hours

Institutional Component

Orientation: 36 hours; introduction to the world of work, general health and sanitation, work attitudes.

Nursing Arts, Lecture and Practice: 70 hours; bed-making temperatures, bathing, feeding, intake and output, transferring.

Human Anatomy and Physiology: 31 hours; studies of such systems as blood and circulation, digestive, excretory.

Nutrition: 4 hours; emphasis on proper diet.

Library and tours: 8 hours.

Testing: 6 hours; aptitude and intelligence tests.

Community Relations: 12 hours; personal growth and development.

Current Events: 8 hours; reporting on current events to gain experience in speaking before a group.

TOTAL: 160 Hours

Trainees were at the hospital for 3 eight-hour days a week. Two days a week were spent in the Project. The entire program was set up to run for 400 hours, or 10 weeks. This was expanded occassionally to 12 weeks as the needs of individual groups were considered. This was one of the few training programs in the Project which had a definite training time limit. This could be done in this occupational field primarily because the material to be learned could be absorbed within the time limit set up for the program, and because the academic requirements for employment in this field were relatively low.

Both MDTA and NYC trainees were involved in the nurse aide training program. MDTA trainees were uniformly involved in a combined program of classroom instruction and related vestibule training stations. Initially, the NYC trainees were involved only in the classroom phase and continued on nontraining related work stations. As has been previously indicated, this latter approach was far less effective in terms of training, attention in the program and obtaining employment than that utilized with the MDTA trainees. In subsequent coupled programs with NYC, all trainees were placed on training-related work stations in a hospital; this resulted in an increased learning experience, a reduced dropout rate, and a more adequate preparation for employment.

While the training program had as its primary goal the preparation of youth for employment as nurse aides, it had a large-range goal as well. It was anticipated that once trainees obtained employment in the nurse aide field they would have possibilities of upgrading themselves to practical nurse levels. Both the curricula and the attitudinal components of the program were directed toward this end.

4. Pre-apprentice Training Program

39	35	26	10	2	6		1

Positive Terminations: 97.1%
(Employed, School, Military)

Negative Terminations: 2.9%
(Lack of interest)

Trainee Selection Criteria:

Age: 17 to 21
Sex: Male
Grade Level: High school graduation
Special Aptitudes: Potential for entry into apprenticeship program
Training Data:
Approach Taken: Classroom only
Estimated length of training: Three months

The Project was motivated to offer pre-apprentice training for a variety of reasons. The first attempt in this area was brought about by a request from the Urban League. This agency had a number of Negro men who were interested in entering apprenticeship programs with industry, but failed to qualify in entrance examinations. A pilot program was attempted with 24 men, to see what could be achieved in a relatively short period of time. These men were employed in non-apprenticeable occupations, and consequently, the pilot program was set up to be operated two nights a week. All 24 men were able to pass apprenticeship batteries after the training program and four were admitted into apprenticeship training programs directly. The others are still on waiting lists at this time and their prospects for employment in apprenticeable trades is dubious. The statistics listed above do not include this initial group of men, since they were over 21,

the program was operated at night, and the individuals were all employed prior to entering the training program.

On the basis of this pilot program, the Project became interested in applying the techniques utilized with the Urban League men to an unemployed disadvantaged youth population. It was felt that there were many Negro youth who would be interested in employment in apprenticeable occupations but rather lacked the qualifications for entry or were unaware of the benefits associated with employment in this area. The Project obtained the co-operation of the Detroit Board of Education to initiate a recruiting program among the males in a graduating class from two inner city high schools. Youth who were interested in the possibilities of entering apprenticeship programs were enrolled by MESC counselors in the MYEP pre-apprentice training program. The goals of this program were varied. One aspect was directed toward making these youth aware of the various opportunities for employment in the apprenticeable occupations. Another was assisting these youth in making realistic choices for themselves in order to enable them to realize the goals they had set for themselves. This might mean preparation for employment; it might also mean furthering their education on the college level. Since these were youth who had just completed high school, a third aspect of the program was directed towards the problems of maturity, the transition from school to employment, life as an adult, etc.

The youth were involved in a program for 4 eight-hour days per week. Their time in this Project was divided equally between academic preparation for apprenticeship employment and preparation for life as an adult. The following program outline will provide an indication of both of these aspects and the kinds of materials covered in the half-day academic and half-day supportive components. The Project testing staff was responsible for the development and communication of the academic materials and further data in this aspect of the program is contained in the report of the testing department. A coordinator was assigned to handle the nonacademic component as well as the supportive services required by the trainees.

<u>Instructional Component</u>

A. MECHANICAL REASONING

1. Physical Systems

a. Effects of gravity
b. Effects of centrifugal force
c. Mechanical advantage
    1. Lever
    2. Inclined plane
    3. Pulley systems

d. Gearing ratios
e. Resistence effects (friction)
f. Multiple force effects
    1. Gravity
    2. Friction
g. Temperature dynamics
h. Fluid mechanics
i. Action - reaction dynamics

B. SPACE RELATIONS

1. Sheet metal applications
2. Volume determination

C. NUMERICAL ABILITY

1. Addition
   Subtraction
   Multiplication
   Division
2. Decimals
3. Fractions
4. Square roots
5. Percentages
6. Discounts

D. ABSTRACT REASONING

1. Problem figures
2. Number series
3. Letter series
4. Word series
5. Syllogistic reasoning
   a. Major premise
   b. Minor premise
   c. Conclusion
   d. Deductive reasoning

E. VERBAL REASONING

1. Analogous Systems
   a. Form relations
   b. Meaning relations
   c. Position relations

2. Definitions
   a. Word origin
      1. Prefixes
      2. Suffixes
      3. Stems
      4. Roots
   b. Linguistic Theory
      1. Spelling
      2. Punctuation
      3. Syntax
      4. Usage

Supportive Component

Orientation Sessions

1. Read and discuss Ford training manuals
   a. Knowledge of selection procedure
   b. General knowledge of at least ten trades
   c. Role of minority groups in apprentice selection

II. Class reports on related trades
   a. Individuals to report on specific occupations
   b. All reports to be oral-related to unit on public speaking
   c. Written assignment; class essays on three trades

III. Plant tour: as soon as can be arranged

IV. How to interview
   a. Application blanks
   b. The psychology of interviewing
   c. The rights and responsibilities of the applicat in an interview
   d. Mock interviews

V. The problem of automation
   a. The meaning of automation
   b. Cybernetics
   c. The social and political implications of automation
   d. Values and promises
   e. Threats and dangers
   f. The impact of automation upon specific trades
   g. Automation and the problem of leisure

Outline of Topics for Discussion

I. What does it mean to be a man?
   a. The search for the self
   b. Why man's self-identity is in confusion
   c. Man and woman: The fundamental difference
   d. When does a boy become a man
   e. The relation of work to manhood

II. World problems
   a. The need for a world perspective
   b. Most significant problems
   c. The relation of world problems to individuals
   d. Viet Nam and personal anxiety

III. Images of man: an objective presentation of some alternatives

a. "The playboy philosophy"
b. Nihilistic Existentialism
c. Marxism
d. Humanism
e. Religious view

IV. The meaning of maturity

a. Dependence-independence
b. Relation to reality
c. Authority
d. Mastery of negative emotions
e. Postponement of gratification
f. Intimacy
g. Communication

V. Money and taxes

a. Meaning and power of money
b. The need for budget
c. Taxes
d. How to fill out income tax forms

VI. Automation

a. Meaning
b. Impact
c. Cybernation
d. Relation of automation to vocational training

VII. Leisure time

a. The increase in leisure
b. The problem of leisure
c. Possibilities of creative use
d. The dangers of leisure

VIII. Public speaking

The academic portions of the training program were developed in terms of existing employer requirements and in conjunction with them. Employers required a broad base of knowledge upon which they could build during the four-year apprenticeship period. The Project goal in this aspect was to provide each individual with the knowledge needed to enter and to complete an apprenticeship program.

The supportive component was developed to meet a different kind of need. Minority youth have traditionally had difficulty in entering apprenticeship programs. Academic deficiencies accounted for some of these difficulties, and the academic portion of the program was designed to correct this. The supportive component was designed to deal with the attitudinal, personal, and social problems often used as a basis for the exclusion of minority individuals.

Results

Ten of the thirty-five youth who were terminated from this project entered directly into apprenticeship programs. The majority of the twenty-six who were employed in nonapprenticeable occupations could have entered apprentice programs if they had so desired. These youth were those who, during the course of the training program, decided that they were not interested in apprenticeship occupations and developed other interests instead. A fairly typical example of what occurred during the training program, M.C. was undecided when he entered the program as to his future goals. During the period of his participation in the program, he decided that his real interest was in Business Administration. He did not have the funds available for a college education. Many private employers have programs wherein an individual is hired and has the opportunity subsequently of taking college courses on a part-time basis at the company's expense. As the employee acquires further academic background, he is moved up within the company. M.C. decided that he would prefer this to embarking on a college program on a full-time basis. He was employed by the largest automotive manufacturer in Detroit as a junior accountant and, after his

probation period, will begin work at a university in Business Administration. While M.C.'s employment was not directly related to the training received in the Project, it was a result of the experiences he had in the Project, both academic and supportive.

The pre-apprentice program was considered by the MYEP to be a highly successful endeavor. This was true not primarily because of the entry of youth into apprenticeship occupation, but because youth were enabled to rethink their goals, establish new ones in some instances, and finally were enabled to realize them.

5. Auto Mechanic Training Program:

Enrolled	Terminated	Employed	Training Related Employment	School	Military	Neutral	Negative
41	38	19	11	4	3	0	12

Positive Terminations: 68.4%
(Employed, School, Military)

Negative Terminations: 29.3%
Lack of interest

Trainee Selection Criteria:

Age: 17 to 21
Sex: Male
Grade Level: none required; some high school preferred

Training Data:

Approach taken: Classroom and vestibule stations
Estimated length of training: six months

Accompanying the growth of the utilitization of motorized vehicles has been an increasing demand for trained individuals who are able to maintain, service, and repair these vehicles. The Project has endeavored, through its auto mechanic training program, to prepare disadvantaged youth for entry-level employment in this field. The requirements for entry-level employment in this occupational field vary extensively with the needs of individual employers. The Project training program was set up to provide a variety of work experiences from elementary to the more advanced levels of automotive repair. It was realized that some individuals might possess the aptitudes for a thorough training program; others would be able to absorb only the basic essentials in this field and would require years of actual work experience to develop into highly skilled mechanics.

Trainees were involved in an 8-hour per day, five days a week program. This consisted of 24 hours on vestibule work training stations and 16 hours of related automotive instruction.

City of Detroit departments (Motor Transportation, Public Works Fire Department and Detroit Streets and Railways Commission) were utilized to provide work experience and training in an actual job situation. Trainees were assigned to individual mechanics within the various personnel in the automotive repair division of the above mentioned city departments (superintendants, supervisors, foremen, and mechanics). Without the cooperation of those departments, the Project would not have been able to offer training in this occupational field since it lacked the facilities and equipment needed to conduct an auto mechanics training program.

The attached curricula and work experience assignment will give some indication of the kind of program that was operated. This comprises the full range of the program and was designed to provide a well trained entry level employee. Certain portions of the program were covered in a classroom setting, particularly the orientation section. However, all other aspects were covered formally by the training station and the classroom phase. A trainee would receive a basic introduction to a specific area or task. He would then be exposed to work in this area at the training station. If needed, further classroom time would be spent reinforcing the experience at the training station. As each job task was completed satisfactorily, the space on the right of the program outline would be signed and dated by the mechanic at this training station or the classroom instructor. An individual file was kept on each trainee's progress. A trainee was considered ready for employment when he had completed a sufficient number of tasks to qualify for employment. This was also correlated with the individual trainee's potential. Thus, an individual with a higher aptitude might complete more tasks and, subsequently, receive a higher level entry job, while a trainee with more limited potential would complete tasks sufficient to obtain employment in a somewhat less demanding situation.

Program Description

AUTOMOTIVE SHOP AND JOB STATION REQUIREMENTS
FOR MAYOR'S YOUTH EMPLOYMENT PROJECT
AUTO MECHANIC TRAINEES

APPROVED:
Superintendent of Motor Transportation City of Detroit:

_____

Auto Repair Supervisor Motor Transportation City of Detroit:

5. Adjust hand brake	_____
6. Remove and install master cylinder	_____
7. Remove and install brake	_____
8. Bleed a brake system	_____
Steering	
1. Learn basic types of steering units	_____
2. Diagnose steering trouble	_____
3. Adjust steering	_____
4. Check and adjust steering mechanism for alignment	_____
5. Remove and install steering linkate	_____
6. Remove and install steering gear	_____
Rear Axle	
1. Learn movements of a rear axle	_____
2. Diagnose rear axle trouble	_____
3. Remove and install rear axle assembly	_____
Springs	
1. Remove and install a leaf spring	_____
2. Remove and install a coil spring	_____
Universal Joint	
1. Remove, lubricate and install universal joint	_____
Transmissions	
1. Learn types of transmissions	_____
2. Diagnose transmission trouble	_____
3. Remove and install a transmission	_____

AUTO MECHANICS

	DATE COMPLETED
Clutches	
1. Diagnose clutch trouble	_____
2. Remove and install a clutch	_____
3. Adjust clutch pedal clearance	_____
Lubrication	
1. Lubricating system	_____
2. Repack front wheel bearings	_____
3. Packing universal joints	_____
4. Lubricate a complete chassis	_____
Minor Body Adjustments	
Doors	
1. Remove and install and adjust door latch	_____
2. Adjust door hinges	_____
Windows	
1. Remove and install and adjust windows lift mechanism	_____
Windshield Wipers	
1. Remove and install windshield wiper motor	_____
Heaters	
1. Remove and install can heater controls	_____
2. Adjust heater controls	_____
Hood	
1. Adjust hood and hood latch	_____
Rear Compartment door	
1. Adjust rear compartment door and latch	_____
Body Bolts	
1. Torque body bolts	_____
Automotive Engine	
Cooling Systems, Radiator, Water Pumps and Thermostats	
1. Learn parts, function and operation of an automobile cooling system	_____
2. Learn operation of engine thermostats and how to test for correct operation	_____

	DATE COMPLETED
3. Correctly drain cooling system, install radiator hose, check anti-freeze and check visually for leaks	_____
4. Remove and install a water pump and adjust belt	_____
5. Disassemble a water pump, rebuild and reassemble a water pump	_____
6. Study typical car heating systems	_____
Engine Ignition and Timing	
1. Learn firing order of common six and eight-cylinder engines	_____
2. Install timing gears	_____
3. Install timing chain	_____
4. Check valve timing	_____
Carburetors, Fuel Pumps and Manifolds	
1. Learn function and operation of current model carburetors, fuel and vacuum pumps, disassemble, assemble and test pump	_____
2. Learn intake and exhaust manifolds and install a set of manifold gaskets	_____
3. In tall, adjust, and test carburetors	_____
4. Learn purpose of carburetor and manifold heat controls	_____
5. Learn purpose and adjustment of automatic choke	_____
Lubrication Systems, Oil Pumps and Filters	
1. Learn different filter systems and pressure controls	_____
2. Learn different types of oil pumps, remove, disassemble, assemble and replace oil pump	_____
Complete Engine	
1. Learn function of principal engine parts	_____
2. Learn types of engines in use today	_____
3. Engine principles	_____
4. Tune engines 4, 6, 8	_____
Automotive Electricity	
Electrical Circuits	
1. Learn relationship of volt, ampers and ohms in simple circuits	_____
2. Measure voltage drop	_____

AUTO MECHANICS

Batteries	
1. Study and test dry cells and storage batteries	_____
2. Study 6 volt and 12 volt battery charging systems and completely charge & battery	_____
Ignition Circuits	
1. Trace and test primary ignition circuit	_____
2. Trace and test secondary ignition circuits, including spark plug wires	_____
Spark Plug	
1. Machine clean and adjust spark plugs	_____
2. Test spark plugs in a pressure chamber	_____
Ignition Timing	
1. Ignition time and engine	_____
2. Check ignition timing with timing light engine running	_____
Starting Motor	
1. Disassemble, inspect and assemble a starting motor	_____
2. Clean brush holders	_____
3. Study starter control devices	_____
Generators	
1. Inspect and assemble an automotive generator	_____
2. Test generator output	_____
3. Recondition a generator commutator	_____
Light and warning device circuit	
1. Trace and inspect horn circuit	_____
2. Trace and inspect lighting circuit (head, tail, back-up, interior lights)	_____
3. Trace and inspect turn signal and stop light circuit	_____
Regulators	
1. Inspect and adjust air gap, point clearance, spring tension for controlling generator output	_____
2. Check and adjust regulator in a generator battery regulator circuit	_____

Results

The time required for trainees to acquire the necessary background for employment varied with the individual trainee. The following analysis will give some indication of this individualized rate of development:

Months in Training	Trainees
2	6
3	2
4	2
5	3
6	2
7	0
8	2
9	1
12	1
	19

Average length in training 4.7 months

Again, it appears to be indicated that the length of time spent in training before a job was obtained is based primarily on the background of the trainee prior to entry into the Project. In addition, each trainee was retained in the program as long as he was willing to continue, and as long as it was felt that he could continue to benefit from the program.

6. Dietary-Aide Training Program

Enrolled	Terminated	Employed	Training Related	School	Neutral	Negative
25	24	14	10	1	5	4

Positive Terminations: (Employed - School) 62.5%

Negative Terminations: (Lack of interest) 16%

Trainee Selection Criteria:

Age: 17 to 21
Sex: Male or Female
Grade Level: none required

Training Data

Approach: vestibule stations only
Estimated length of training: four months

The Project entered into this training program as an experiment with the Skills Center. Trainees were selected from that agency who had been involved in the program of education and sheltered work experience at the Skills Center cafeteria. Each trainee who was selected by the Skills Center was to have had the necessary basic education and vocational training (institutional) prior to their entrance into MYEP. MYEP was then to place these trainees in a straight vestibule training station, in the cooking area, for four days per week. The fifth day was to be spent back at the MYEP for counseling and guidance. The purpose of the trial program was to explore the possibilities of utilizing vestibule stations only, after youth had received the necessary educational and vocational training instead of simultaneously with the vestibule stations, to see if this would complete their training and prepare them for work.

After two weeks orientation at MYEP, the trainees were placed on the vestibule training stations in the dietary departments of various hospitals. As the program progressed, it became evident that a vestibule program alone was inadequate to meet the needs of disadvantaged youth. While they may have acquired the necessary knowledge and skills needed to perform their duties at the vestibule stations, they lacked the attitudinal and motivational factors essential to becoming a satisfactory employee. They also needed additional instruction to supplement their vestibule experience.

It was the opinion of the MYEP staff that the needs of disadvantaged youth are best served by a combined institutional and vestibule approach when a program is designed to teach occupational skills and to prepare these youth for employment. The institutional phase alone is inadequate since it fails to provide experience in an actual work situation. The vestibule phase alone is inadequate since it fails to provide additional occupational information and the supportive services essential to the preparation of disadvantaged youth for employment. Since the youth were in the stations for four days a week, this left insufficient time to deal with the personal and social needs of the individual trainee; it also provided no opportunity for remedying knowledge--gaps uncovered by the vestibule experience.

MYEP did not offer any further training programs in this area primarily because it lacked the staff and facilities needed to provide a meaningful training approach in the dietary aide or cook-helper category.

In our first contract year, dietary-aide training was provided in a combined approach, i.e., classroom and vestibule trainees received both basic and occupational education in the Project context, and actual job training at a vestibule station. This proved to be a far more effective approach than that attempted during this contract period.

7. Retail Sales Training

Enrolled	Terminated	Employed	Training Related	Negative
19	19	18	18	1

Positive Terminations: 94.7%
Negative Terminations: 5.3%

Trainee Selection Criteria:

Age: 17 to 21
Sex: Male or Female
Grade Level: ,high school graduation preferred but not required

Training Data

Approach: classroom and on the job training
Estimated length of training: Three (3) months

The basic approach utilized in the retail sales training program was similar to that found in other training programs where vestibule stations were involved. The trainees were in Project classes for two days a week during which time materials were presented in the area of merchandising (customer contact, sales techniques, displays, credit buying, sales and luxury taxes, etc.). The remaining three days each week were spent with a major retail merchant (Sears-Roebuck Co.) in a work-training situation. Trainees were employed by Sears for 24 hours per week and paid the minimum starting wage. They were not regarded as regular employees but as sales trainees. Department managers were directly involved in the training of those individuals and in an evaluation of their performance in the job situation. A co-ordinator from the Project staff visited the training supervisor and the trainee on the job site at periodic intervals to assess trainee progress and determine areas where the trainee could use more help. Information found during the training station contact was communicated to Project staff, and an attempt was made to correct deficiencies, provide new information, review previously covered material, etc., when the trainee spent the two class days at the Project.

The program lasted for 12 weeks. At the end of this time, trainees who had completed the program were offered employment by Sears. In terms of a training experience which led to employment, this program was unusually successful. Eighteen of the nineteen trainees were retained by Sears in sales capacities. However, there were certain factors connected with the retail sales field which made the Project question the advisability of offering further training in this area. It is a fairly common practice among retail stores to start new employees on a contingent (on-call) or part time basis rather than as full-time employees.

This was the experience of the trainees who completed the program with Sears. In some instances this led to full-time employment; in others, trainees were continued in part-time capacities only. This proved to be quite discouraging to several trainees who subsequently quit their jobs when full-time employment did not appear to be a possibility in the immediate future.

While it is true that there is a need for retail sales personnel, considerable caution should be used before embarking on a training program in this area. Unless there are fairly secure assurances that successful trainees will obtain full-time employment, this area should be avoided in designing programs for a disadvantaged population. It is not always easy to interest disadvantaged individuals to participate in a training program to begin with. It is an extremely disappointing experience to complete a program successfully and then to be "rewarded" by part-time employment. As a result of this one factor the Project did not continue training in this area.

8. Supermarket Pre-On-The-Job Training Program

This program was designed to complement the type of services provided to youth enrolled in the Neighborhood Youth Corps. In many instances, NYC enrollees were able to make the transition from their NYC experience directly into jobs or into on-the-job training programs with private employers. However, this was not always true for every NYC youth. Just as many NYC youth required additional occupational training and basic education before they can meet employer requirements for jobs, so many NYC youth require additional training before they can enter into an on-the-job training (OJT) program. This program was intended to prepare NYC enrollees to enter an OJT program with a supermarket chain as cashiers, stock clerks and meat wrappers. NYC trainees were to continue their work experience for 3 days a week; the remaining 2 days they were to participate in the MYEP. During these 2 days they were given a basic orientation to supermarket employment (merchandising principles, customer-employee relationships, fundamentals of the work to be performed, etc., as well as supportive services (counseling, testing, grooming, etc.). The curriculum utilized was a project of joint planning with the city OJT staff, MYEP staff, and personnel from the supermarket chain. As trainees completed the program they were to enter the OJT phase with the supermarket.

All nineteen trainees completed the program; however, the expected OJT slots did not materialize at the time when the MYEP phase was completed. Consequently, none of the trainees entered the OJT program. One youth was placed directly into employment with a locksmith; another returned to school, two of the remaining seventeen

entered MYEP's clerk-typist program. Fifteen left the MYEP phase and continued their NYC work experience.

MYEP continues to feel that it is important ot provide a supplement to NYC to prepare youth for entry into OJT programs. However, much more extensive planning is needed before another program of this nature would be attempted. Full employer co-operation and participation in the pre-OJT phase should be secured. Definite OJT slots should be developed, preferably with the pre-OJT trainees in mind. NYC work experience should be related to the training received in the MYEP phase. In general, as much effort and planning must go into the preparation of youth for OJT programs as goes into the preparation of youth for employment. Even though OJT is technically a training program, private employers expect a certain degree of productivity, knowledge of the occupational field, and good work habits. In many ways the expectation is similar to that associated with the employment of new personnel directly. A pre-OJT program must be cognizant of this and develop its approach accordingly.

9. Special Projects

In addition to the programs previously discussed in this section, the Project also became involved in operating programs of a somewhat different nature. One such program was discussed briefly under pre-apprentice training (sec. E,4.) and is fairly typical of the remaining two which will be covered in this section. Trainees were not youth, they received no allowances, participation was on a voluntary basis, and classes were conducted after normal working hours.

A. Alexandrine House Project

The Alexandrine House is a non-profit residence established for parolees. It provided a home for men who have been incarcerated and who have subsequently become eligible for parole. The House serves as a half-way situation: a place where parolees can adjust to the community and to "normal" life during the transition from life "inside" to life "outside". The men reside at Alexandrine House until they become employed in full-time fairly steady capacities and are subsequently self-sustaining.

One of the major difficulties encountered by parolees in their attempts to exist as members of society is that of obtaining employment. Employees are usually reluctant to hire individuals with police records; this reluctance is intensified when an individual is on parole. The difficulties for the parolee are further compounded if he is Negro. In this sense the personal background and characteristics of the parolee, nature and number of offenses, and the length of incarceration constitute the major impediment toward securing a job. This is true even if the parolee has acquired a skilled or semi-skilled trade prior to or during his incarceration, or if he possesses good scholastic abilities or high aptitudes. The task of finding employment is increasingly difficult for the parolee who, in addition to having a police record, lacks academic proficiency, high aptitudes, or specialized occupational training. When employment can be obtained for either of these two types of parolees, it is often of a temporary nature, and on an unskilled level with commensurate low pay and high job insecurity. The kind of work which parolees are able to get (or unable to get plays a determinative part in the repetitiveness of criminal behaviour.

With these things in mind, the MYEP felt that it could extend its services of counseling, guidance, testing, class work and job placement to this particular population in an attempt to minimize the obstacles faced by parolees in obtaining employment, and to maximize the potential of the parolees who would be involved.

Since Alexandrine House was "home base" for the parolees, the Project activities were conducted at the facility. We began by interviewing all those who were interested, tested them, and made an initial attempt to evaluate their abilities and potentials. Those who tested well or had marketable skills were referred directly to employment by the Project placement staff. Those who tested fair to poor or who had inadequate skilled backgrounds were designated for additional class work which would be directed at increasing their knowledge and abilities.

Class sessions were established and scheduled to meet twice weekly for periods of two and one-half hours each time. The classes provided remedial work in arithmetic and English, instructions on test taking procedures, practice in completion of application forms, and the development of job interview techniques. Attendance at these classes was on a voluntary basis; parolees participated when they wanted to, and continued until they obtained employment or until they lost interest. Because of this voluntary aspect, considerable effort was directed toward securing employment quickly.

Approximately twenty different men were interviewed each month during the six-month period when the program was in effect. Between six to ten men were involved in each class session that was conducted,

with different men entering and leaving the house and the class as well.

Ten men were placed on jobs with the steel company mentioned in the discussion of the metal processor program. Ten others were placed in various kinds of employment commensurate with their aptitudes and skills (auto mechanic, clerical, semi-skilled factory work, etc.). These twenty were involved in the classes conducted by a Project staff member.

Twenty other individuals were placed in jobs as a result of Project involvement, although they did not participate directly in the class work component. In some instances, individuals lacked tools needed to begin a job; these were provided by the Project. In other cases, the parolees who possessed required skills but had encountered obstacles because of their background.

In view of the highly mobile nature of the parolee population, numerous personal obstacles to employment, noncompulsory nature of the program, and the attitudes of employers toward men with police records, MYEP feels that the results achieved in this initial attempt were highly satisfactory. Alexandrine House is continuing to work with parolees along the lines developed by MYEP.

B. Police Preparation Program

At the request of the Commission on Community Relations (CCR) and the NAACP, MYEP initiated a program for men, 21 years and over, who wanted to be police officers but had failed the entrance examination. These individuals were close to the minimum requirements and

93

were otherwise well qualified, but did lack certain skills and knowledge. The program was designed to accomplish academic improvement, increase physical fitness, and provide an introduction to the function of the police department and the policeman.

Since the individuals selected for this program were employed, training was conducted on Saturdays from 9:00 a.m. until 3:00 p.m., for eight weeks. Trainees participated on a voluntary basis, and the program was conducted by the MYEP Director of Testing.

The first sessions were devoted to diagnostic testing for the purpose of assessing strengths and weaknessess. On the basis of this testing, the specific course context was developed in the following manner:

<u>Curriculum Component 9:00 - 11:00 a.m.</u>

I. Vocabulary
   A. Word origin
      1. Prefixes
      2. Suffixes
      3. Stems and Roots

   B. Spelling
      1. Rules
      2. Exceptions

   C. Word Definitions
      1. Cognates
      2. Synonyms
      3. Antonyms
      4. Homonyms

II. Mathematics
   A. <u>Basics</u>
      1. Addition
      2. Subtraction
      3. Division
      4. Multiplication

   B. Decimals
   C. Fractions
   D. Percentages
   E. Discounts
   F. Elementary principles of Algebra

III. Mechanical Reasoning
(A brief introduction to:)

A. Physical Systems
1. Gravity
2. Centrifugal force, inertia
3. Levers, inclined planes, pulleys
4. Friction
5. Temperature and fluid dynamics

IV. Abstract Reasoning
A. Problem figures
B. Number series
C. Letter series
D. Word series (relationships)

V. Verbal Reasoning
A. Analogous Systems
1. Form relations
2. Meaning relations
3. Position relations
4. Elementary logic and reasoning
a. analogies, syllogisms, etc.

Physical Conditioning and Lunch 11:00 a.m. - 1:00 p.m.

During this period the men underwent a rigorous physical development program at a neighboring Y.M.C.A. The purpose of this aspect of the program was to develop physical abilities to twice that of the minimum police academy requirements.

Related work: discussion topics 1:00 - 3:00 p.m.

1. Law

2. Police techniques and equipment
a. Firearms
b. Vehicles
c. Special equipment
d. Fingerprinting

3. Community relations
a. Community agencies

4. Relationship to the Fire Department
a. Special roles

5. Crime Statistics
   a. Adult crime
   b. Juvenile crime

6. Special Crime Categories
   a. Narcotics
   b. Extortion
   c. Robbery
   d. Break and entry

7. Related films and slides from the academy

8. Speakers
   a. Police Department
   b. Community agencies
   c. Related governmental departments

Thirteen men started the program; seven completed it. The six who left did so because of an apparent decreasing interest in attempting to obtain employment with the police department. The seven men who completed the program were subsequently tested by the Department; three men passed and were employed by the Police Department. For a more complete discussion of the program, see the testing report.

C. Male - Female Ratios

This section will concern itself with the analysis of the sexual composition of the regular training programs in terms of enrollment and terminations (positive, negative, and neutral). This will not include data on the special programs conducted by the Project (Urban League pre-apprentice, pre-police, and Alexandrine House); these all involved males only.

The following data indicates what percentage of the enrollment was male and female, and the percentages of males and females involved in terminations for positive, negative, and neutral reasons.

	Male	Female
Enrolled	36.4%	63.6%
Positive Terminations	46.5%	53.5%
Negative Terminations	58.8%	41.2%
Neutral Terminations	16.3%	83.7%

Explanatory Narrative:

1. Enrollment:

Of the total number of trainees involved in regular programs, 36.4% were males and 63.6% were females. It was the Project's intention to have a much higher percentage of males, but external conditions prohibited this. At the beginning of the contract year there was a sufficient number of unemployed males available for training, and the first ratios in AYEP were 60% - 40% with males predominating. However, the labor market situation altered radically in Detroit; toward the end of the contract year it was virtually impossible to secure males for training since almost any male could obtain employ-

ment, at least in unskilled capacities, if he so desired. As a result, trainee composition in the latter part of the contract year was almost entirely female. AYEP felt that the training programs should reflect the needs of the unemployed population; as the proportion of unemployed females who were available for training increased, the Project adjusted its structures to provide more training programs in female areas.

2. Terminations:

If a normal pattern prevailed, one would expect that terminations for male and female for positive, negative and neutral reasons would be distributed on the same percentage basis in the enrollment. It would be expected that of the positive terminations roughly 36% would be males and 64% would be females, and similarly for negative and neutral terminations. However, this was not the case. While males constituted 36% of the population, they accounted for 46.5% of the positive terminations, 58.8% of the negative terminations, and only 16.3% of the neutral terminations. Females, who constituted 63.6% of the trainee population, account for 53.5% of the positive terminations, 41.2% of the negative terminations, and 83.7% of the neutral terminations.

Within the male and female populations, the following will indicate the percentage of each group who were terminated for positive, negative or neutral reasons:

	Males	Females
Positive Terminations	76.8%	69.6%
Negative Terminations	18.5%	10.4%
Neutral Terminations	4.7%	20%

The major reason for termination in both groups is positive, i.e., employment, school, further training, military service; it is 3½ to 4 times greater than the next highest reason for termination. The differences between male and female are slight with regards to positive terminations, since proportionately, more males are terminated for this reason. This difference may be accounted for in part by the fact that the labor market was more desirous of obtaining male trainees. Another factor was the length of time involved for training males for jobs imposed to the length of time required for training females. The majority of males could be trained within a two to four month period; as a result there was less opportunity for nonemployment terminations since this goal could be achieved in relatively short periods of time. On the other hand, approximately 85% of the females were involved in training in excess of three months.

Of most interest in the comparison of males with females is the area of nonpositive terminations. The males had a significantly higher <u>negative</u> termination rate than the females. It became obvious to the Project staff that if males did not obtain employment relatively quickly, they lost interest in the training process and subquently dropped out. Females, on the other hand, could persist in a training experience for much longer periods of time.

In general, males continued in training until they obtained a job or until they lost interest. Females continued in training until they obtained a job or until personal problems (sickness, pregnancy, etc.) prohibited them from completing their training.

D. The Relationship of Training to Employment

	MALE	FEMALE	COMPOSITE
Training Related Employment	66%	94%	82%
Nontraining Related Employment	34%	6%	18%

The overwhelming majority of jobs obtained by trainees was directly related to the kind of occupational training received in the project. Only 18% of the total placements were not directly related to the training provided by MYEP, this should serve to indicate a high correlation between the kind of training provided by the Project and the kind of job which was ultimately obtained. Nontraining related placements should be viewed in terms of a number of factors.

1. One of these factors was the objectives of the Project. Ultimately, MYEP hoped to place youth in entry level jobs. The primary consideration was the interest of the trainee in a given occupational field and his aptitudes for performance in this field. In effect, the Project was more concerned with trainee-related job placement than with training-related job placement. While trainee acceptance of jobs in nontraining related areas was of concern to the Project staff, these terminations were not considered unrelated to the overall ob-

jectives of the Project. Although this employment was not directly related to the training received, it was directly related to the comprehensive impact of the Project on the lives of the trainees: counseling, medical, and testing services; classroom instruction; work experience gained through vestibule training; the combined evaluation of the trainee by various staff members; and the activity of the placement division.

2. Higher Employment Potential

On a number of occasions, after a trainee had been screened by various referral agencies (MESC, NYC, Skills Center) and assigned to a specific training category, subsequent testing and counseling at the MYEP indicated that this trainee was capable of a higher level of employment than that provided for by this category to which he had been assigned. In instances such as these, trainees were placed in employment where it was felt that their maximum potential would be utilized. For example, two males were originally placed in an auto mechanics training program. Subsequent test scores indicated high verbal, mathmatical and mechanical aptitudes. Interviews with the trainees by various staff members (teachers, coordinators, counselors, job placement) confirmed their preference for employment in a more technical field. They were subsequently placed in technical training positions with Bell Telephone where they have excellent prospects for promotion, economic advancement, and personal development.

3. Lower Employment Potential

In some instances, trainees were placed in categories where, even after training, their skills and/or knowledge were inadequate for em-

ployment in their training category. This occurred most frequently among males in the metal-processing training program. As has been mentioned before, fairly rapid acquisition of jobs was very important for male trainees. In a number of cases in metal-processing training, it appeared that it would take a considerable length of time to evaluate them to employer standards in this field. Job placements were made for these youth in semi-skilled capacities in other areas. This was only done when the trainee concurred with staff opinion. If a trainee wished to continue in training, the staff would continue to work with him toward obtaining his goals, or until it became evident to him that a change of goals was in order.

4. Economic and Labor Market Factors

While all of the trainees in the Project were economically deprived, some felt a greater degree of pressure from their home environment, or their personal needs to obtain employment as quickly as possible, even if this was not in their designated training area. Again, this was more true for male than females. There was an unusually high demand for unskilled factory employees among Detroit employers. As a result, a number of male trainees (and a few female trainees) obtained employment in these unskilled but high-rating capacities. Although these trainees could have obtained employment in the areas of their specific training, they decided in favor of the higher earnings available at the time because of increased production in the automotive industry. The Project attempted to defer trainees from entering these types of jobs, and, for the most part, was successful. However, as in other matters, the wishes of the trainees

were the determinative factor in whether they stayed in training or accepted unskilled employment.

In some instances, Project staff aided trainees in acquiring these jobs. This was done in cases where the acquisition of money was needed to forward individual trainee goals--college education, impending maternity expenses, etc.

In general, females obtained employment in the areas of their training(6% nontraining related employment). It was among the male trainees that the greatest number of nontraining related placements were made. 34% of the jobs acquired by males were in nontraining related areas; the reasons for this were almost equally divided among the above mentioned factors.

E. Duration of Training

The following table indicates the length of time spent in a training program before a job was obtained. The table reflects only those trainees who were terminated for employment, and does not consider the length of time spent in training by an individual who was terminated for neutral or negative reasons, who returned to school, or entered military service. It includes MDTA and NYC trainees, but does not include special programs (Urban League, Police Alexandrine House).

Months In Training	Clerical	Metal Processors	Nurse Aides	Pre-Apprentices	Auto Mechanics	Dietary Aides	Retail Sales	Total
1	21	33		4		1		59
2	11	39		10	6	2		68
3	15	21	84	10	2	2	18	152
4	8	15		2	2			27
5	8	8			3	1		20
6	4	1			2	2		9
7	8	1				3		12
8	9	1			2	2		14
9	6				1	1		8
10	8							8
11	5							5
12	7				1			8
TOTAL	110	119	84	26	19	14	18	390

A discussion of the individual training categories has been included in Section E on the training report. With the exception of two categories, nurses aides and retail sales, training programs were designed on an open end basis. Trainees were to stay in the programs until they reached employable levels; no arbitrary cut off rates were established for terminating an individual group. Trainees entered the occupational programs at different levels of academic proficiency and skill development, therefore, their progress towards employment varied in duration based largely on these factors. In many instances, medical, social, and personal problems were impediments in the trainee's development. These had to be resolved, along with academic and skill deficiencies, before an individual could obtain a job.

All of these factors required an individualized, yet total, approach to the training needs of our population, individual config-

urations of liabilities and assets accounted for the fact that trainees in a given occupational field (clerical, for example) might remain in training anywhere from one month to twelve months before a job was acquired.

Part of the problem in a traditional educational setting has been the failure to take into account gross differences in rates of development. In MYEP a trainee was "finished" with his training only when the goal of a job was achieved; and the Project staff was committeed to working with an individual for as short or long a period as was required to achieve this goal. As long as a trainee was interested in continuing to work toward obtaining a job, he was allowed to continue in this program. If his interest abated, attempts were made to rekindle it. If these attempts were futile, the trainee usually excluded himself from the training process.

In the case of nurse aide and retail sales training, the Project deviated from its normal pattern in that it set up a definite time limit for the training process. For both programs this was approximately three months. In these two occupational areas the duration of the training exceeded by far the training given to a new employee in these fields by employers. Hospitals spent between two and three weeks training nurse aides. Retail stores often have no training program for new employees; if they do, it merely lasts longer than one week. In both of these fields training is given in the course of the actual job performance. The Project felt that in three months it could provide good basic training in these areas for disadvantaged

youth. Part of the training experience was on-the-floor activities with hospitals in one case, and retail stores in the other. It was felt that if an individual could not develop for employment in these two areas within three months, there was little prospect of this occurring in a longer period of time. MYEP experienced no difficulty in training youth for employment as nurse aides or retail sales clerks within this time span, and the training provided by the Project established a foundation upon which employers could build after a trainee was employed.

F. The Use of Vestibule Stations for Training

In the first year of operation, the vestibule station was a component of virtually every training program; trainee time was divided equally between the institutional-classroom aspect and the vestibule work-training station. Vestibule stations were not utilized as extensively in the second year of operation. The following chart indicates the number of trainees who were enrolled in a classroom situation only, those in a classroom-vestibule station program, and those who were in a vestibule station only.

	Classroom	Classroom & Vestibule	Vestibule
1. Clerical	20	239	
2. Metal Processors	165	22	
3. Nurse Aides	63	171	
4. Pre-Apprentices	63		
5. Auto Mechanics		41	
6. Alexandrine House	40		

	Classroom	Classroom & Vestibule	Vestibule
7. Dietary Aides		7	18
8. Retail Sales		19	
9. Supermarket OJT		17	
10. Police Training	13		
	301	516	18

The combined usage of classroom and vestibule stations was the predominant technique adopted in the training of the majority (62%) of MYEP enrollees. 36% of the total number of trainees enrolled were trained through a classroom situation only. 2% were involved in a vestibule station only with no classroom supplementation.

The particular approach which was adopted in each instance was dictated primarily by entry-level employment requirements and requirements for job performance. Vestibule stations provided the opportunity for the development and utilization of skills in a work situation; this was a necessary element in the training process for clerk-typists, nurse aides, auto mechanics, retail sales clerks and dietary aides.

One attempt was made to train clerk-typists (20) in a classroom situation alone. They received academic instruction and typing training for four days each week on the hypothesis that what was needed for clerical employment was the improvement of communication skills and typing abilities. These trainees had been on NYC work stations for a number of months prior to entering MYEP, and it was felt that they would profit more from a concentrated classroom experience than

they would by dividing their training time between the classroom and the vestibule station. This experiment was initiated in the last month of the contract year and data is not available on the outcome of this approach.

In training programs where no vestibule station was utilized, there were various reasons for this. The Alexandrine House program was operated at the House in the evenings and involved part-time voluntary participation training for specific occupational areas; help was provided on an as needed basis to interested parolees. In the pre-police training program, the object was to prepare individuals to enter the police training program. What was required was academic and physical preparation, and this could be accomplished without the use of vestibule stations. This situation also prevailed in the pre-apprentice training process. Youths were prepared to enter and complete an apprenticeship program. Primarily, this required development of academic skills. The actual apprentice program would provide four years of on-the-job training and little could have been accomplished by the use of vestibule stations. Employers were interested in hiring youth who possessed academic backgrounds sufficient to pursue further training, and this was the task which the Project set for itself. In the case of metal processors, the primary employer requirement was the possession of a specific level of mathematic ability. If an individual possessed this, the employer would undertake the responsibility of training him for a specific job. Vestibule stations could not duplicate the work situation in the steel industry and could add little to improving mathematical levels; therefore, they were not utilized.

In general, vestibule stations were utilized where they would be of direct benefit in preparing youth for employment. They had to be training-related stations where specific occupational skills could be acquired and developed. If youth were acceptable to employers with any skill development, (as with metal processor apprentices, and police) vestibule aspect was sufficient.

Vestibule stations have proved highly effective in the development of good work attitudes: punctuality, attendance, relations with co-workers employers, etc. They also served as a guage to measure the effectiveness of the institutional component in resolving the academic, skill, personal and social deficits of trainees.

From a training viewpoint, the vestibule stations acted as an incentive for learning in the institutional setting. What a trainee received in the classroom had direct relevance to his tasks at the vestibule station and could be put into effect in a practical situation immediately. There was virtually no cap between learning and doing, and trainees could readily perceive the practical reasons for absorbing classroom materials.

G. Co-operative Programs: Neighborhood Youth Corps and MYEP

From February to July, 1966, MYEP was involved in a joint effort with the Neighborhood Youth Corps (NYC), to provide occupational training in an institutional setting for NYC enrollees.

The basis of the NYC approach is the assumption that work experience and supportive counseling services are sufficient to enable disadvantaged youth to develop the attitude and skills necessary to

obtain regular employment. While NYC has had a measure of success with this approach, it was found that many youth did not reach employable levels through work experience and counseling alone. Pilot programs were subsequently developed with MYEP, whereby MYEP would complement the services offered through NYC by providing instruction in occupational areas, knowledge of test taking techniques, additional counseling, and job placement. The experience of MYEP had been that neither work experience nor classroom instruction as an independent component were sufficient to enable the majority of disadvantaged youth to make the transition from employment to unemployment. A total approach was required--classroom instruction, work-station experience, counseling, testing, medical remediation, and job placement. The needs of disadvantaged youth are manifold, and training programs must attempt to deal with all their needs if youth are to be aided in a meaningful fashion. MYEP has attempted to operate in this manner since its inception, and it was with this in mind that the pilot programs were designed.

Two plans were devised. Plan 1 involved the preparation of NYC for entrance into an on-the-job training program; this has been discussed in a previous section of the report.

Plan 11 consisted of providing NYC enrollees with both classroom instructions in occupational areas and the total range of project services in order to enable them to obtain full-time employment. NYC enrollees continued their work experience for three days per week (8 hours per day), and were paid at the rate of $1.25 per hour for

the 24 hours worked. The remaining two days each week were spent at MYEP on a voluntary basis without monetary compensation, and it was during these two days that the services of MYEP were made available to the NYC enrollees.

The Michigan Employment Security Commission (MESC) was responsible for the selection and referral of NYC trainees who had interests in and aptitudes for the type of training offered by MYEP. MESC was also responsible for counseling interviews with each NYC enrollee every two weeks. Initially, these interviews were held at MESC offices; subsequently, MESC provided staff at the MYEP training site and this proved to be a more satisfactory way of fulfilling the counseling function.

NYC had the primary responsibility for conducting the work experience aspect of the coupled program. NYC assigned trainees to work stations, visited these stations regularly, and handled pay for the time worked. NYC personnel were also involved in counseling contacts with three trainees.

The primary task of MYEP was to provide institutional training in a classroom setting. This was directed toward equipping NYC enrollees with the academic and vocational skills required to obtain employment in various areas: clerical, nurse aide, auto mechanics and metal processors. MYEP also provided counseling, medical services, test preparation, and job placement.

The following chart indicates the results of the NYC-MYEP pilot program under plan 11 for the original 103 NYC enrollees only.

Training Category	Enrolled	Terminated	Positive	Negative	Neutral
Clerk Typists	44	39	22	16	1
Nurse Aides	38	38	24	7	7
Metal Proc.	15	15		15	
Auto Mech.	6	6	5	1	
	103	98	51	39	8

"Terminated" refers to termination from the MYEP aspect of the coupled programs.

"Positive" terminations include employment, return to school or entrance into an MDTA program on a full time basis. (45 of the above were for employment.)

"Negative" terminations indicate those trainees who left the MYEP phase because of lack of interest. They may or not have continued with NYC in the work experience program.

"Neutral" terminations include illness, pregnancy, and relocation.

While there were certain positive aspects resulting from this coupling arrangement in terms of inter-agency cooperation and the effect on the trainees, it is the opinion of MYEP that its effectiveness in dealing with the problems of the trainees was seriously curtailed. For the past two and one-half years, the Project has worked with disadvantaged youth in terms of a total approach to training, and has sought to bring to bear the total resources of the Project in the task of training youth for jobs. The coupling programs, as they were initially instituted, reduced the Project involvement with trainees to two days a week, primarily in a classroom setting.

MDTA trainees who participated in the Project during this contract period were involved in the total MYEP program. The results of the effectiveness of the Project with MDTA trainees in comparison with NYC trainees appears obvious in the following statistical analysis:

	MDTA	NYC
Positive Terminations	80%	52%
Negative Terminations	9%	40%
Neutral Terminations	11%	8%

While 80% of MDTA terminations were for positive reasons, only 52% of the NYC terminations were positive. Among MDTA trainees, only 9% were terminated for negative reasons; for NYC trainees 40% were negative terminations. A number of factors were present in the training of youth under MDTA allowances that were absent in the coupling programs with NYC. The absence of these factors accounts for the relatively poor results achieved with NYC enrollees.

I. MDTA trainees were paid a weekly training allowance for participation in a five-day training program. NYC trainees were paid only for the work experience portion, and were expected to participate in the classroom aspect without compensation. Trainees paid under MDTA received less per week than NYC enrollees, but understood from the outset that they were being given an allowance to assist them in obtaining training. NYC enrollees began their experience in NYC with the understanding of receiving pay for time spent in the program. When they became involved with MYEP, they were not paid for the time spent with that agency. In effect, whether they took part in the MYEP training or not, their weekly pay would be the same.

As a result, the financial incentive for obtaining training was lacking with NYC trainees and contributed to their failure to attend MYEP classes.

2. In the case of MDTA trainees, allowances were under the control of the training agency (MYEP). This was not the case with the NYC enrollees.

3. MDTA trainees were the total responsibility of MYEP and this permitted a unitary approach to the solution of individual problems. There was multi-agency involvement with the NYC enrollees which tended to fragment the individual.

4. MYEP staff was not involved in the work-station portion of the NYC enrollee's experience and had to rely on feedback from NYC counselor aides on trainee progress, problems, etc. Even when the feedback was good, this still interposed a second person between the NYC enrollee and the MYEP staff

5. Since NYC enrollees spent only two days each week at MYEP, there was insufficient opportunity to provide a full range of supportive services. Whatever supportive services were provided cut into trainee class time.

In the light of this data, subsequent discussions were held with NYC which led to a modification of the original coupling arrangements. Any future NYC enrollee who is referred for training at MYEP will become the responsibility of MYEP in a more complete way. MYEP will make assignments to and coordinate the work-training stations of NYC enrollees involved in MYEP training. While NYC enrollees will

continue to be paid for time worked, they will be expected to participate on a five-day basis with MYEP. MYEP coordinators will be responsible for reporting time to NYC and the distribution of checks to trainees. By assuming the responsibility for work experience, distribution of pay, institutional training, medical remediation, counseling, testing and job placement, it is anticipated that MYEP will be able to provide a more unified, intensified and more effective training experience for NYC enrollees.

IV. TESTING

A. Approaches to Appraisal

1. Self Selection

Trainees are self-selecting to the extent that they have registered at MESC for admission to training programs. The registration suggests an inability to acquire gainful employment under their existing abilities without assistance of the State Employment Service.

2. Initial Batteries

All entering trainees are given a basic battery of tests designed to assess relative strengths and weaknesses. The findings of the initial testing are transmitted to counselors, coordinators, and instructors. The instructors design their curriculum at the level indicated by the initial testings. The basic test battery consists of the Otis, Wonderlic, Mooney Problem Check List and Numerical Ability, Abstract Reasoning and Verbal Reasoning subtests of the Differential Aptitude Test.

Other tests are used in experimental situations and as requested by department heads.

Early use of non-verbal instruments indicated that AYEP trainees score about one-half of one standard deviation below national norms. Verbal tests yielded approximately one standard deviation below national norms.

Since non-verbal instruments are not used in business and industry except on rare occasions or as a part of a verbal battery, non-verbal testing has been essentially abandoned.

B. Use of Test Results in Selecting Trainees

Trainees are not selected on the basis of test scores at AYEP. Generally, trainees have been tested at MESC or have been selected on the basis of interviews with an MESC counselor. Test results may be used to separate, for instance, a group of forty trainees into two groups. If the groups are being split on the basis of a high or low group, then the top and bottom halves are split. If equivalent groups are desired, then an odd-even split is made.

1. State of the Art

The Society for the Psychological Study of Social Issues has conducted substantial research in the area of minority group testing.

They state, "The present report examines how this unfortunate situation may be remedied and its objective is to set down some criteria for interpreting test scores obtained from children who do not have the advantages of the middle class child. But it is more than that, for the guidelines set forth can also serve as a basis for constructing more appropriate testing instruments. It is the hope of the Society that the report will stimulate a reformulation of the issue of intelligence testing of such an order that present, often inadvertent, injustices can be removed."[1]

They further state, "Standardized tests currently in use present three principal difficulties when they are used with disadvantaged minority groups: (1) they may not provide reliable differentiation in the range of the minority group's scores, (2) their predictive validity for minority groups may be quite different from that for the standardization and validation groups and (3) the validity of

their interpretation is strongly dependent upon an adequate understanding of the social and cultural background of the group in question."[2]

The findings at AYEP appear to generally confirm these findings. General reading deficiencies contribute significantly to depressed test scores.

Other research findings about the characteristics of minority group children are consistent with AYEP's experience.

"Most of the evidence relating to the contention that the majority of educational and psychological tests tend to be more unreliable, i.e., more characterized by what is technically called 'error variance', for minority group children, is indirect, being based on studies of social class and socio-economic levels, what characteristics may be expected to affect differences rather than on minority group performance per se. Nevertheless, the particular kinds of minority groups that we have in mind are closely associated with the lower levels of socio-economic status. The results of studies by Warner, Davis, Deutsch, Deutsch and Brown, Havighurst, Hollingshead, Sears, Maccoby and many others are cases in point. Many of these studies are discussed by Anastasi (1958), Tyler (1956) and Deutsch (1960).

For children who come from lower socio-economic levels, what characteristics may be expected to affect test performance in general, and the accuracy or precision of test results in particular? The list of reported characteristics is long, and it is not always con-

sistent from one investigation to another. But, at least, it may be hypothesized that in contrast to the middle class child the lower class child will tend to be less verbal, more fearful of strangers, less self-confident, less motivated toward scholastic and academic achievement, less conforming to middle class norms of behavior and conduct, more apt to be bilingual, less exposed to intellectually stimulating materials in the home, less varied in recreational outlets, less knowledgeable about the world outside his immediate neighborhood, and more likely to attend inferior schools."[3]

2. Test Consciousness

Minority group trainees are acutely aware of their status when taking tests. Intelligence testing specifically seems to produce culture inequalities. The Haggard experiment in Chicago reveals strong cultural effects on performance and practice.

"THE HAGGARD EXPERIMENT." As mentioned above, another major empirical investigation in the Chicago research program was designed to examine the effects of motivation, training, and certain other conditions on intelligence test scores. Specifically, Haggard predicted that lower class children would show substantial improvement in their test scores under the following conditions: a) when they were tested on an intelligence test form in which the content was more in keeping with the language and experiences of lower class children, b) when test items were read aloud to them instead of depending upon them to read the items to themselves, c) when they were given practice in answering questions similar to those which appear on intelligence tests, and d) when either their practice or their

test taking was motivated by the promise of a free pass to a movie for a good performance. Haggard evaluated these predictions by measuring the intelligence of nearly 700 high and low status children on a conventional test and then separating them into a variety of experimental groups of 40 to 50 children each. These groups, were then subjected to different combinations of experimental conditions. All were retested five days later, some with the conventional test and others with a revised form of the test, some under motivating conditions and some not, some with practice during the intervening days and some without such practice, and so on. Haggard's fundamental question was, "Would lower class children improve more in their scores than higher class children under the predicted circumstances?"

"As one might imagine, the number of comparisons reported from this study was large, and they cannot be itemized in detail here. Generally speaking, the results were mixed and inconsistent. Thus, it was the high status and not the low status children who benefited from the practice sessions, particularly when they were retested on the conventional test. In some experimental conditions the investigator's attempts to motivate the children decreased the retest scores of high and low status children alike, in other conditions the motivation attempts made no difference, and in still others motivation improved the retest scores of low status children but not high status children in accordance with Haggard's predictions. The lower status children showed substantial gains when they were retested on the form of the test deliberately revised to make it more suitable for them, but these gains were overshadowed by the fact that higher status

children also showed remarkable gains on the revised form.

In sum, while Haggard's study was unable to demonstrate that social class differences in intelligence were fully accounted for by such matters as motivation, practice, test forms, and the like, it did show that test scores of children, whether of low or high status, could be influenced by these factors. Test performance, the investigator concluded, depends upon the experience children bring with them and upon the psychological factors in the testing situation itself. The mere revision of current intelligence tests to remove their middle class bias would not be sufficient to measure mental ability adequately."[4]

C. Testing as Training

A heavy emphasis is placed on testing at AYEP for several reasons. First of all, diagnosis of difficulties is crucial for curriculum development. Tests are also used extensively for practice effect. Generalized anxiety can be significantly reduced through familiarity with types of tests, questions, and exposure to standard testing conditions. An attempt is made to reproduce testing environments which will be found in business and industry. Extensive orientation about what to expect in job interview environment is given.

D. Special Projects

1. Project Exploration (see appendix)

   a. Proposal
   b. Research design

Analysis of Results - The results of Project Exploration are currently being prepared for key punch operations and final computer analysis. Final results should be available by the end of the calendar year.

1a. TESTING AT ST. LEO'S JOB CLINIC

The testing program at St. Leo's was established to screen and determine ability level. Testing was used for this purpose only, not to eliminate anybody. A short battery of tests was used. The Wonderlic Personnel Test and the Otis Quick Score were chosen for this purpose.

The results indicated that these two tests may not be valid indicators of problem solving ability for the population under consideration. The results of the testing indicated that there were at least two factors limiting the valid measurement of problem solving ability for the population. The first factor was the reading ability of the population. There were members of the population from homes of bilingual background. There were members of the population from homes with limited amounts of reading material available. Because of these two factors, the results obtained from two verbal tests were not valid indicators of problem solving ability.

A rank correlation between the two tests showed little significant relationship. The rank correlation was .37.

Graph 1 shows a comparison of intelligence, as measured by the Otis Quick Score Test, between the national, MYEP and St. Leo's populations. The national mean I.Q. is 90-110 with a high average of 100-110. The MYEP mean I.Q. was 102 with a range from the low sixties to a high of 126. The St. Leo's mean I.Q. was 85. There was a range from a low of 65 to a high of 117.

These results indicate that the population under consideration

differs from the other two populations. One of the factors previously mentioned, reading and verbal difficulties, can be considered a significant factor in this difference.

Although the MYEP population and the St. Leo's population were of a similar nature there was a significant difference in I.Q. as measured under standard conditions with the same instrument. There was a difference in mean age between the two populations. The results of age comparison and mean I.Q. score for the St. Leo's population show that the younger population scored significantly higher than the older population. Graph 2 shows that the mean I.Q. for age group 14-25 was 92. The mean I.Q. for age group 26 and up was 79.

Several factors can be said to influence these results. It is very possible that a large part of the older group has a residence and educational background from the South. It is a fact that many of the schools do not meet the standards of schools in the North. It is also a fact that many of the schools in this city are not at the level of quality they should be. Both of these age groups were exposed to these types of education. This is a partial explanation of the difference between both groups and the national norms and differences between the age groups.

Another important variable concerns the grade level attainment in school and the amount of time between test date and last school attendance. These two factors influence test scores considerably.

Graph 3 indicates that the mean male I.Q. was 92. The mean female I.Q. was 85. There was, however, a higher percentage of young males in this population which would, according to the factors mentioned relative to age, account for the large difference.

Graph 4 shows a comparative distribution of scores, by age group, attained on the Wonderlic Personnel Test.

Graph 5 shows the distribution of scores for the St. Leo's population. The range of scores was 0 to 23. The mean was 12. The mode was 16. The median was 12.5. According to the Wonderlic manual 12.3 is the expectancy for eight grade level of educational achievement.

Graph 6 shows the comparative distribution of Wonderlic scores on a sex basis. The male mean score was 14. The female mean score was 10. According to the Wonderlic manual the mean score for males at the eighth grade achievement level is 13.4. The mean for females at the same level is 11.2.

2. PRE-POLICE ORIENTATION SEMINAR

PURPOSE

The purpose of this seminar is to provide intensive and highly specialized orientation to the knowledge and skills required of persons preparing to become policemen.

There exists a demand for well qualified young men in police work; yet the rigorous physical, mental, and emotional requirements, coupled with an economy of near full employment has resulted in fewer applications for police work.

There are a substantial number of young men who approach minimum requirements and are otherwise well qualified, but lack certain skills and knowledge. This knowledge and certain specific skills may be gained by these men in a relatively short time, if they are

GRAPH 2

taught in a program specifically designed for that purpose, and by a specialist in the field.

The Mayor's Youth Employment Project will provide the physical facilities, the program, and the specialist for this seminar.

DURATION

It is anticipated that the program will run for a period of six to eight weeks on Saturdays. The program will begin at 9:00 a.m. and continue until approximately 3:00 p.m. The period between 9:00 a.m. and 11:00 a.m. will be devoted to classroom activities. The period between 11:00 a.m. and 1:00 p.m. will be devoted to physical conditioning and lunch. The period between 1:00 p.m. and 3:00 p.m. will be devoted to correlative activities designed to complement the morning session.

Period I - 9:00 - 11:00 a.m.

CURRICULUM DATA

The first two or three sessions will be devoted to diagnostic testing for the purpose of assessing strengths and weaknesses. On the basis of this testing, the specific course content at the appropriate level will be established. This specific course content will be drawn from the following areas:

I. Vocabulary
   A. Word origin
      1. prefixes
      2. suffixes
      3. stems and roots

B. Spelling
   1. Rules
   2. Exceptions

C. Word Definitions
   1. Cognates
   2. Synonyms
   3. Antonyms
   4. Homonyms

II. Mathematics
   A. Basics
      1. Addition
      2. Multiplication
      3. Division
      4. Subtractions
   B. Decimals
   C. Fractions
   D. Percentages
   E. Discounts
   F. Elementary Principles of Algebra

III. Mechanical Reasoning

(A brief introduction to:)

   A. Physical Systems
      1. Gravity
      2. Centrifugal force, inertia
      3. Levers, inclined planes, pulleys
      4. Friction
      5. Temperature and fluid dynamics

IV. Abstract Reasoning

   A. Problem figures
   B. Number Series
   C. Letter Series
   D. Word Series (Relationships)

V. Verbal Reasoning

   A. Analogous Systems
      1. Form Relations
      2. Meaning Relations
      3. Position Relations
      4. Elementary Logic and Reasoning
         a. analogies, syllogisms, etc.

Period II 11:00 a.m. - 1:00 p.m.

PHYSICAL CONDITIONING AND LUNCH

During this period, the men in the seminar will undergo a rigorous physical development program conducted at the Northeastern Y.M.C.A. The week to week program will vary as abilities increase, but basically the goal will be at least twice the minimum Police Academy requirements. In the event that these men are accepted into the Police Academy, they will be able to handle the physical training with little difficulty.

Lunch will also be fitted in to this period.

Period III 1:00 p.m. - 3:00 p.m.

RELATED AND COMPLEMENTARY WORK

During this period, the men will be introduced to such topics as salaries, working conditions, and other related information. It will be valuable if a Police Department representative can be available occasionally.

Other material will include basic mnemonics, observation techniques and other material that might be suggested by the Police Department.

It is, of course, obvious that a great deal of material is included in this program, however we know, from experience that it can be handled. The final duration of the seminar will depend on the rate at which the men assimilate the material but a period of six to eight weeks is anticipated.

COPY OF A LETTER

December 17, 1965

MEMORANDUM TO: CCR Committee on Police-Community Relations

Rev. Nicholas Hood, Chairman
Mr. Henry J. Szymanski
Mr. Stanley Winkelman
Father James J. Sheehan

FROM: Jimmy McGowan

The following educational training program is proposed in effort to reduce the shortage of police officers in the City of Detroit. The shortage of minority group members in the Police Department is even more acute than the general shortage.

The Manpower Development Training Program presents the opportunity to interest young men, from minority groups of the city in a career with the Police Department, by making it possible to offer a course to assist them to pass the patrolman's examination.

While the proposal of this program is motivated by the relative ineffectiveness of standard recruitment procedures among minority group persons, and the acute shortage of minority group personnel in the Police Department, we feel that it should not be limited exclusively to minority group members, but that a vigorous attempt be made to recruit minority group members.

This proposal while modeled after a program designed by the City of New York differs, in that we suggest the persons selected be selected from the files of the Detroit Police Department, Office of Personnel Examiner and should meet all other requirements for acceptance to the established training programs, but are in need of remedial educational aid in certain basic areas such as: reading comprehension, spelling, basic math, and English comprehension. Also, as a means of ensuring that the persons selected will be able to do a professional job with the maximum effectiveness the curriculum should also include courses in human relations, clerical skills, occupational orientation, law enforcement observing

and reporting, patrolman's duties, health and physical education and driver education. We recommend that a six month intensive training program be instituted with the aim of raising the educational attainment of the applicants.

There should be no compromising with the standards as set forth by both the Civil Service Commission and the Police Department. It should be expected that upon completion of the course and satisfactory passing examinations the persons will be appointed recruits and assigned to the Police Academy for training there.

We propose that persons from concerned agencies be involved in drawing up the final proposal to be submitted to the Office of Manpower Development and Training design the curriculum, establish facilities and take care of all details, problems, etc. encountered in getting the program started. As a first step in this direction we feel that the staff and facilities of the Skills Center would be ideal for this program.

In addition to cooperating and assisting in program development, the Police Department will have the added functions of scheduling at the Police Academy classes in physical training and a course aimed at acquainting the young men with the patrolman's duties. The physical classes should be designed to ensure that the student will successfully pass the qualifying examination given as a requirement for becoming a police officer.

Initially, we recommend that a planning meeting of the concerned agencies, i.e., Detroit Police Department; CCR; Detroit Board of Education; Michigan Employment Security Commission; Manpower Development and Training Act Advisory Board; Total Action Against Poverty Policy-Advisory Committee, the NAACP, OJT and DPOA be called to work out the details of the program.

We feel that educational requirements and content of the program should be cooperatively arranged with the Detroit Board of Education and the Detroit Police Department. We also suggest that the services and facilities of the Michigan Employment Security Commission and other appropriate agencies be utilized whenever possible.

This program will serve both the expressed desires of the Police Department; the community, and the applicants by effectively reducing the shortage of police officers, increasing minority group representation, as well as giving an opportunity to deserving young men to be public servants in an honorable service to their community.

TENTATIVE SCHEDULE OF SPEAKERS FOR
PRE-POLICE TRAINING

February 12	Inspector Robert Quaid - General Orientation to DPD
February 19	Research and Planning Bureau - Techniques and Equipment
February 26	Deputy Superintendent Paul Sheridan - Crime
March 5	Community Relations - Community Agencies 1. Civil Rights Commission 2. Commission on Community Relations 3. National Association for the Advancement of Colored People 4. Police Department Citizen Complaint Bureau
March 12	Lt. Leo Shanks, Youth Bureau
March 19	Special Crime Categories - Inspector Robert Kerr (Vice, Narcotics, etc.)
March 26	Detroit Police Officers Association - Special Roles - i.e. first aid, etc.

COPY OF A LETTER

This is to remind you of the examination for the Police Department and the debriefing session to be held immediately afterwards. The examination will be held on Saturday, April 2, 1966 at 8:00 in the morning sharp, room 207, 1300 Beaubien, Detroit. The examination should last until approximately 11:00 a.m.

The debriefing session will be held at the St. Thomas School, Fischer and Chapin immediately afterwards.

Much success with the examination; I'm sure you won't have any difficulty.

Sincerely,

Jim McGowan
Field Representative

JM:tmj

COPY OF A LETTER

March 22, 1966

Mr. Burton Bradley
Mayor's Youth Employment Project
1501 E. Ferry
Detroit, Michigan 48211

Dear Sir:

Congratulations on having almost completed the Pre-Police Training Class. It is our continued hope that your experience in the class will enable you to pass the departmental examination with minimum difficulty and stand you well in your career as a police officer.

In the last class on Saturday, March 26, 1966, Sgt. Avery Jackson of the Recruiting Division of the Detroit Police Department will take your application for the examination which will be administered on April 2, 1966. Sgt. Jackson will also give you some pertinent information concerning the examination and the department. We cannot emphasize enough the importance of your being present Saturday, March 26, 1966.

Please call me either at my office or my home to confirm your presence on Saturday. Office: 963-9550. Home: 896-4284.

Sincerely,

Jim McGowan

JM:em

COPY OF A LETTER

May 25, 1966

Mr. Richard Strichartz
Controller
City of Detroit
Detroit, Michigan

Dear Mr. Strichartz:

Mr. Healas asked me to prepare for you a detailed report of the recently completed Pre-Police Orientation Seminars conducted in cooperation with the Commission on Community Relations.

To facilitate your complete understanding of the program from its inception, I have enclosed six items number 1 - 6 in chronological order.

Item 1 is a memorandum to the CCR, Committee on Police-Community Relations from Jim McGowan, which is a proposal for the program. We designed a program along these lines and it is described in item 2.

Item 2 is a detailed description of the program as I conceived it, operationally. Because these men were employed, it was necessary to conduct the Seminar on Saturday.

Item 3 is a schedule of speakers for Period III of the program.

Item 4 is a copy of the letter sent by Mr. McGowan to each of the program participants.

Item 5 is another letter from Mr. McGowan reinforcing test time and debriefing session.

Item 6 is a breakdown of the final results of the exam taken in the police department. These people had taken the test before so we were able to compare the two test scores.

Under I.Q. you will see three columns: Prior, Current, and Loss and Gain.

The prior column gives scores from the original test. The current column is the most recent score and the loss and gain represents the degree of change.

I spoke with Mr. McGowan today and was told that three of the eight men who took the test are being hired and assigned to the Police Academy. On page 2 of item 6 is the breakdown of overall ratings. The first three scores 68, 58, 57 represent the three who are being hired.

Racially, the group consisted of five Negroes and three Caucasians. The three who are being hired are also the three Caucasians.

If there are details you would like beyond what I have given, you may reach me at 921-1322.

Yours truly,

Burton Bradley
Director of Testing

BB:pr

PRE-POLICE SEMINAR EXAM RESULTS: April 2, 1966

On Saturday, April 2, 1966 the men from the pre-police seminar took the Police Department exam. Each of the men had taken the general battery at least once, but the batteries are equivalent rather than identical. The subscores of prior tests and current tests are given:

I. Q.

	Prior	Current	Loss & Gain
1.	101	104	+3
2.	101	100	-1
3.	102	90	-12
4.	99	93	-6
5.	96	93	-3
6.	95	93	-2
7.	93	88	-5
8.	92	90	-2
	779	751	

Net Loss = 28 points
Average Loss = 3.5 points of I. Q.

SPELLING

	Prior	Current	Loss & Gain
1.	24	26	+3
2.	22	23	+1
3.	15	20	+5
4.	14	19	+4
5.	9	20	+11
6.	8	16	+8
7.	6	5	-1
8.	0	4	+4
	98	133	

Net Gain 35
Average Gain 4.4

OVERALL RATINGS

	Prior	Current	Loss & Gain
1.	68	73	+5
2.	58	71	+13

Net Gain 88
Average Gain 11

SUMMARY AND TENTATIVE CONCLUSIONS

Three areas of comparison are reported here, I.Q., spelling and overall rating.

The I.Q. ratings indicate an average loss of 3.5 points. The range between the prior and current scores is from -12 to +3 or 15 points. Of the 8 tested, 7 lost points and 1 gained points.

The spelling ratings indicate an average gain of 4.4 points. The range between the prior and current scores is -1 to +11 or 12 points. Of the 8 tested, 1 lost points and 7 gained points.

The overall ratings indicate an average gain of 11 points. The range between the prior and current score is +4 to +20 or 16 points. All of the 8 tested gained in overall rating.

On the basis of the across-the-board decrease in I.Q. scores it may be assumed that the current test is probably on equivalent form with a correction factor of +4 -6 points. The scores were depressed on average of 3.5 points.

The spelling tests indicate an increased ability with fairly large gains. This suggests that a longer period of practice would probably be fruitful inasmuch as spelling ability may be learned with practice.

The universal increase in overall ratings suggests that the experiment is generally successful but that the time limits imposed (8 weeks, 2 hours per day) are inadequate.

3. TESTING SERVICES FOR WAYNE COUNTY BUREAU OF SOCIAL AID

The Wayne County Bureau of Social Aids provides an educational service for Aid-to-Dependent-Children mothers. The purpose of the service is to provide classroom instruction pertaining to the skills necessary for employment as postal workers.

On two occasions this year the testing department has provided auxiliary services for these students. The purpose of the services was to present a rational approach to test taking.

Listed below is the format of the presentation.

A. Preliminary Discussion

1. Purpose of tests
   a. Screening
   b. Measurement
   c. Evaluation

2. Types of tests
   a. Intelligence
   b. Aptitude
   c. Achievement
   d. Personality

3. Meaning of results
   a. Raw score
   b. Derived score
   c. Percentile

4. Value of results
   a. Counseling
   b. Job Placement

B. Approach to Tests

1. Psychological set
   a. Vocabulary
      1. Word origin
      2. Prefixes
      3. Stems and roots

   b. Spelling
      1. Rules
      2. Exceptions

   c. Word definitions
      1. Cognates
      2. Synonyms
      3. Antonyms
      4. Homonyms

   d. Mathematics
      1. Addition
      2. Subtraction
      3. Multiplication
      4. Division
      5. Decimals
      6. Fractions
      7. Percentages

   e. Abstract reasoning
      1. Problem figures
      2. Number series

   f. Verbal reasoning
      1. Form relations
      2. Meaning relations
      3. Position relations
      4. Logic

C. Test Practice

1. Timed test
2. Test debrief

At the conclusion of each session a test was administered and the results were later reported to the instructor.

4. SYSTEMATIC ERROR ANALYSIS IN TYPING

An experiment has been initiated for the purpose of improving typing. The experiment consists of a systematic error analysis which is designed to isolate and identify specific typing errors, and tabulate them. It is postulated that typing errors tend to follow a pattern which is not always identifiable without specific isolation. It is further postulated that systematic analysis will focus attention on the particular error which is most prevalent and cause the student to direct her attention toward the correction of the error. High level errors (most prevalent) may be eliminated in order of their relative frequencies. Initial pilot experiments have shown significant improvement when the system is used. It is assumed that the improvement is attributable in part to systematic analysis.

Errors are categorized as: misspellings, mistrikes, reversals, omissions, additions, substitutions, and miscellaneous. A daily tabulation is kept and rate of improvement is charted. Daily evaluation by the instructor allows initial remedial drills as indicated.

5. GAS STATION ATTENDANTS

A group of six women from the Work Experience Program started a class at AYEP to train as service station attendants.

The testing department provided two types of testing services for these people. The first type was a battery of aptitude and special aptitude tests to determine the ability level of each person and recommend any indicated remedial work. The second type of test used was the personality inventory test. This semi-projective in-

ventory is used by the counseling staff to determine needed psychological and health counseling.

6. STATISTICAL STUDIES

A. The IPAT 16 PF was given to a group of 20 young women. After completing the test, they were instructed to rate themselves on the profile sheet. The true profile was then obtained and superimposed on the estimated profile. The maximum deviation was on factor "C" (emotional stability) = 2.7. The minimum deviation was factor "H" (venturesome vs shy) .06. Chart 1 shows the mean and sum of the deviations for each factor. It can be seen that the subjects were within a reasonable range on their estimates. This indicates that their self-concept is realistic.

	MEAN D	SUM OF D
A	+2.29	39
B	-.35	-6
C	2.70	46
E	.29	5
F	1.82	31
G	1.05	18
H	.06	1
I	.88	15
L	-1.07	-4
M	-.69	-11
N	-1.59	-27
O	.35	6
O1	.24	4
O2	.65	11
O3	1.41	24
O4	-.59	-10

CHART 1

STATISTICAL STUDIES

B. An analysis of the loss or gain of percentile scores on a mechanical reasoning test was obtained for a pre-apprentice class. The gain or loss was obtained on a test-retest basis. (See Chart 1 in the pre-apprentice section).

There was no loss shown. The maximum gain was 74 points. The minimum gain was 4 points. The mean terminal score was 40. The mean gain was 14 points.

These results would indicate that the method of instruction has proven effective.

E. Standardized Test Batteries - Its Inadequacies

Man perceives objects in his environment and conceives abstract ideas within his sphere of experience. When he observes, for instance, a dog, he involuntarily forms the word-sound "collie" or "cocker spaniel." Along with simple identification of the object he may associate some experiential factor which adds a value judgement such as good, bad, vicious, or pleasant depending on prior association with the object in question. The experiential factor may be direct or indirect. The individual may have been bitten by a dog in the past or may have simply been led to believe that dogs bite, through the experience of another individual. It is likely in this instance that a negative factor of avoidance is added to simple identification. In this way the total image of the concept "dog" is formed. First that the object is a dog and that it is to be avoided. The image may be extended by association to include other animals such as cats. In short, the individual forms an integrated image.

In a similar way man attaches symbols to all objects. The symbol becomes, in effect, the object itself along with its values. Through the process of education in all of its forms man learns the symbols which stand for each of the objects in his environment. As he learns progressively more symbols and how to read, write and speak them, he acquires the skill of synthesizing word groups which have a collective singular meaning. Not only "this is a dog" but "this is a collie, of the type which once caused me pain and which I must avoid." If the individual continues with the educative process, he learns that objects sometimes have more than one symbol and that

they may be combined in a variety of ways. This process is sometimes called degree of literacy.

The individual who is rewarded for his literacy proficiency tends to extend his literacy. He gains practice in "symboling." He learns many symbols and how they may be combined. Middle and upper class people place a great value on literacy and promote it in their ranks. Lower class people place less value on literacy. They receive less practice in "symboling."

In about the third or fourth grade of elementary school students are asked to write about "What I Did This Summer." Some of the children write such things as "My Visit to Yellowstone Park" or "Fun at Camp."

In the process they utilize dozens of new symbols they have learned. It is enjoyable to think back over the rich and rewarding experiences. The poor children have little to relate. "Hanging Around on the Corner" or "My First B & E" somehow doesn't seem appropriate. At this age and grade level a bifurcation occurs. The poor children start to fall behind. Their interest lags as their teacher begins to divert more attention to the students who are more successful. The dropout process has begun. As they shuttle to the back of the room and the far corners, a gloomy, persuasive boredom sets in. Truancy begins shortly and by the time of the eighth grade or so, the only remaining goal is the achievement of age 16 for official drop out. Of course, many drop out before this time.

In some schools, populated exclusively by poor children, teachers are compelled to lower their standards. They find that increments of success are smaller. The pride a teacher feels when his students achieve well is nearly absent. The persuasive language of the poor subculture cannot be overcome. Illiterate parents do not provide the support and encouragement the schools desperately need. The homes of the poor contain few, if any, books. Reading (symboling) is not encouraged. In order to "graduate" any students, the schools do lower standards. The high school diploma has a different meaning. Students who read at an 8th grade level are awarded a diploma, a "pat on the back" and sent into the world of work.

By the end of the following summer the poor graduate has applied for a series of jobs. In almost every case he has been given an employment exam. He has puzzled over a series of new words and symbols and ponderously tried to follow the exam instructions. He isn't accepted. He cannot "symbol" as well as graduates from better homes and schools. After a series of rejections he realizes he is hamstrung by the establishment. His high hope dwindle to desperation and finally bitterness and anger. He can't qualify. He finally accepts a menial job requiring no exam. Each summer the story is repeated. The frustration is immense.

Employers have for many years, relied on standardized test batteries for help in selection of new employees. It has been assumed that potential employees who score well on employment tests will become good employees. This assumption is based on what is called a validity factor. One of the ways of developing an employ-

ment test is to draw a sample of employees who are performing adequately and subject them to a series of questions. Through a process called item analysis the questions which are discriminating, that is, those which are answered most correctly are extracted and listed in a new series. The new series is then used as a screening device under the assumption that efficient work performers answer these questions correctly will be efficient work performers. "Post hoc ergo propter hoc." Unfortunately, these sometimes erroneous assumptions are never questioned. The tests are still used wven when the work itself changes. In many cases the work is essentially unrelated to the validity basis. Smaller companies which cannot afford to develop their own tests rely on tests which may never have been related to the specific work they are performing. The selection process continues, however, and employees are hired or rejected on a basis about as appropriate as the toss of a coin. Of course, tests are not often the sole selection factor. Other selection criteria may include high school marks, general appearance, poise, voice quality and in some cases, "strength of handshake." Test scores and these other qualities are combined and an employment decision is made. So it isn't very surprising that when a youth walks into an employment office dressed casually, extends an unsure handshake or none at all, speaks as little as possible and produces a poor high school transcript, his test score simply verifies what the employer already knew. The polite, "We'll call you if we have an opening" is something the youth already knew also. A few experiences such as this verify that he is unfit, a loser.

Attempts have been made to develop tests free of "cultural contamination." It became clear that particular words such as "sonata," are used in middle class cultures and not used in lower class cultures and that therefore should not be included because of unfairness. It was further concluded that not only words familiar to middle and upper classes should not be used but essentially all words are used more in middle and upper classes and, therefore, create unfair advantage when used in tests. The obvious conclusion was that a test with no words should be used.

Just such a test was developed; in fact, several were developed. As it turns out, the disadvantaged groups still perform below the others. This phenomenon is still being discussed.

The truth of the matter is that all paper and pencil tests must necessarily consist of symbol manipulation. Not only the test, but other employment criteria are symbols, the handshake, the dress, the poise and the spoken language. So we return to the original problem. If your symboling techniques do not conform to acceptable standards you are rejected.

If you hear something like, "This gray boy from the bad crib and his mink copped out when this diddy bop with the cool sky piece made the scene," you can be pretty sure it's some form of English but for the user it is <u>the</u> language. It is distinct, it is precise, it is rich in meaning but it <u>is</u> a different language. When you add a heavy accent, it becomes truly a different language.

So the disadvantaged minority youth is caught in the system. He is evaluated with a tool designed for someone else, and it doesn't fit.

There is a growing body of research which suggests that standardized test batteries are not only inappropriate for certain minority groups but even tend to screen out individuals who are in fact capable of outstanding performance.

In the Journal of Social Issues, the publications of the Society for the Psychological Study of Social Issues, whose contributors include Dr. Jerome S. Bruner, Dr. Herbert Kelmon, Dr. Martin Deutsch and many others of equal status, are found the following statements concerning standardized tests, and I quote, "...their predictive validity for minority groups may be quite different from that for the standardization and validation group and they are dependent upon an adequate understanding of the social and cultural backgrounds of the group in question."

Research by W. Lloyd Warner and his associates in Chicago has shown that children from lower classes performed poorly on intelligence tests because they were either unimportant in or alien to their particular subculture. And finally, Dr. Davis at the University of Chicago also concluded that class differentials in I.Q. scores resulted from cultural bias in intelligence test construction and not from difference in the reasoning ability of children. In short, intelligence tests were unfair to children of the lower class culture.

In our Detroit Project, we have discovered numerous examples of trainees who fail entrance exams but nevertheless perform not only adequately but exceptionally well. Our Federal's Project illustrates this very well.

Now for a look at the pure economics of the problem in question. There is substantial concern that special dispensations concerning entry requirements and special training programs are expensive. I believe I can demonstrate that this is not the case at all.

In a follow-up study of the Detroit Project completed one year ago, we found that among the trainees sampled, their earnings totaled $1,326,000. They paid $153,229 in Federal taxes, $20,398 in state taxes and $11,106 in city taxes. Their average income came to $3,938 annually.

Incidentally, this is only half of the story. If you consider the cost of public assistance, detention in jail or any number of expensive, non-productive measures necessary to accommodate non-workers, then the net profit of these programs to society becomes exponential. And most importantly, how do you measure the value of the individual worth of a human being? We have estimated that many of our trainees have already more than paid for their training. So when the question is raised about the expense of these programs the answer is that these programs are not expensive. They are, on the contrary, profitable.

It is important that business and industry understand the full impact of programs of this nature. Not only do these programs create taxpayers and eliminate welfare recipients but they also create customers. In addition to the direct effect on the individual, the secondary and perhaps more important effect occurs to those individuals who are related. Brothers, sisters, sons, and daughters all profit from successful employment. Success breeds and the welfare chain is broken.

An interesting phenomenon occurred when we retested a group of trainees on a widely used problem check list. This check list consists of a series of problems of all kinds, concerning health, security, family relations and other related areas. We found that problem areas changed from such things as "uncertainty about the future and needing money" to wanting more education and more cultural enrichment. In short, long term employment raises the sights, broadens the horizons and creates optimism. There is almost total absence of welfare histories among people whose close relatives have long employment histories. Again, success breeds success.

In closing--I would like to summarize the points which I feel are most critical. Standard test batteries don't measure the abilities and predict the success of minority group members because they were not really designed to do it. The population sample used to build these tests does not ordinarily include members of the group in question, and should not be used to test them.

Employment programs make economic sense. What may appear to be expensive in terms of tax dollars really turn out to be a profit making venture. Training costs in the huge majority of cases are amortized over a year or two in actual new tax dollars, with the savings in reduced costs for policing and processing through the legal departments there doesn't seem to be much left to argue about.

I believe we are living in a society that is changing in geometric proportions. Each day brings a new technological advance. We are developing new methods of internal organ transplant, we have computers which solve problems in seconds that would take an army of

mathematicians years to solve. With the completion of Gemini II we are on the threshold of the moon. In the United States we have more consumer goods and services than ever before in history. It is an exciting time. I think we can allow everyone to enjoy the fruit of our expanding economy. It is hard to see how unemployment and interplanetary space travel can exist together. Perhaps, they should not!

F. The Role of Social Reinforcement in the Development of Self-Concept

DISCUSSION OF THE TOPIC

It is postulated that the individual's self-concept is a crucial mediating factor between the individual's past social reinforcement history and the amount of effort he is likely to exert for successful job performance. It is further postulated that "disadvantaged people" and more particularly in this case "disadvantaged youth" have poor images of themselves in terms of vocational and educational skills. That is, they have never been led to believe that they are particularly competent, skilled, talented individuals, and they generally think of themselves as relatively inept in relation to academic training or job performance. Extensive psychological research confirms the conclusion that fear and apprehension produced by a past history of self-criticism and self-deprecation virtually assures failure.

("Disadvantaged youth" are defined as people between the ages of 16-21, primarily Negro with a few white youths who reside and attend school in the "inner city" and who qualify as either welfare recip-

94

ients of some form of public assistance. Generally, family incomes will be $3,000 or less per annum with no other visible means of support. This definition is by no means all inclusive, and will serve only as descriptive criteria in a very general way).

The research proposed has the practical aim of finding which, of various possible methods, will alter self-concept from which generalizations can be made about the development of training programs.

THEORETICAL BACKGROUND

Man has a self-concept. In his first year of life he begins to perceive of himself as unique among individuals. His personality and behavior begin in a systematic development. The direction and form of his personality development is based primarily on sensory messages. His physical development is partially hereditary and partially the result of his environment. These basic concepts of human development have been well documented and established.

The primary concern here is that of the process of the development of the individual self-image and how it affects man's behavior and how his behavior, thereby, affects his self-image.

From birth the human organism begins receiving messages which collectively form the image. Boulding in his discussion of imagery states behavior depends on the image and that the image is built up as a result of all past experiences of the possessor of the image. Everytime a message reaches him his image is likely to be changed in some degree by it, and as his image is changed his behavior patterns will be changed likewise. The meaning of the message is, therefore, the change which it produces in the image.[1]

As the human organism becomes able to understand messages from his environment his self-image becomes formed. If he is loved and receives messages to that effect his self-image becomes that of one worthy of loving. If he does not receive the love or nurturance he becomes reticent and withdrawn. This principle has been demonstrated in orphanages (Hurlock Psychology of Development). There is the case of Anna reported by Davis: "Anna could not talk, walk or do anything that showed intelligence. She was in an extremely emaciated and undernourished condition. She was completely apathetic, lying in a limp supine position and remaining immobile, expressionless, and indifferent to everything."[2]

Most of the mental traits we think of constituting the human mind are not present unless put there by communicative contact with others. Research has shown that the closer the correspondence between socializing agencies (school, parents, peers) the more rapidly socialization takes place. I am assuming here that socialization means successful personal relations with others. This process seems to be analogous to the image-building process.

There is a tendency for parents to raise their children the way they were raised, that is they tend to reproduce their image. Hilgard found that mothers identify with certain of their children in complex ways suggesting the perpetuation of her self-image.[3]

Kluckhohn has shown that the emotional tone of communication from parent to child affect subsequent development more than either of the particular techniques of child raising. He suggests that it is the child's perception of the parent's attitude that is important.[4]

Termon's findings carry important suggestions about the probable influence of socialization variables on affiliative behavior.[5] They suggest, for example, that a parent-child relationship which produces strong positive ties is an important influence on the general and life long affiliative behavior of the child--this seems to be confirmed by Sanford.[6] The child behaves as he is expected to behave by his parents, throughout his school experience.

Another research finding is that the severity of the conscience is apparently determined less by the strictness of the child's treatment by the parents than by the related intensity of his feelings for the parents. The child's conscience reflects the parents consciences more than their behavior, and socialization is affected through identification, first with parents, then with others.

Hall and Lindsey suggest that the super ego is modeled upon the earliest parental images, when the parents were thought to be perfect and omnipotent. Super ego takes over the role of external authority figures and exacts conformity to society. The person is said to be socialized.[7]

Parental pressure for and reward of early achievement when coupled with a high ratio of successes to failures results in a high need for achievement in later life. The general finding is supported for example by data which demonstrates that severe training acts adversely for achievement motivation.

In one study, the need-for-achievement score of sons receiving physical rewards was 7.60 as compared with 3.64 for those who did not (McClelland).[8] Other findings indicate the earlier the parental

demands for achievement the stronger the subsequent drive for achievement.

Dr. Maxwell Maltz in a book called Psycho-Cybernetics suggests that discovery of the self-image represents a break through in psychology and the field of creative personality.[9] He practices what he calls self-image psychology. There is today irreputable clinical evidence in the fields of industrial psychology, psychosomatic medicine and industrial psychology that there are success-type personalities and failure-type personalities. He further asserts that self-image psychology may reshape the self-image of a person in a desirable way. He asserts along with Boulding that all actions, feelings, behavior, even your abilities are always consistent with the self-image. In short, you will act like the person you conceive yourself to be. The self-image is a "premise," a base, or a foundation upon which your entire personality, your behavior, and even your circumstances are built. Because of this our experiences seem to verify, and thereby strengthen our self-images and a vicious or beneficent cycle, as the case may be, is set up.

Prescott Lecky conceived of the personality as a system of ideas based upon the ego ideal or self-image.[10] Lecky theorized that if a student had trouble learning a certain subject, it could be because it was inconsistent for him to learn it. He was able to bring about startling changes whenever he was able to induce the student to change his self-image. Salter suggests a similar principle in "Conditioned Reflex Therapy."[11]

It has been postulated that social class accounts for some of the variation in human behavior. The Lynds in their Middletown study reported that a potent factor in continuance of school is the economic status of a child's family.[12] They found that some children left school because they were unable to afford adequate clothing. The two major conclusions of the Lynds study were:

1. Lower class parents are less likely to instill in their children a desire for formal education.

2. Lower class children are penalized within the school system since they do not possess the symbols, attitudes, and behavior characteristics valued by the dominant class group.

A social prestige research conducted by W. L. Warner, Havighurst and Loeb resulted in the conclusion that American schools have a social class screening device, which in actuality keeps at a minimum the flow of upward mobility. The educational institution is described as functioning as sorters of students, rejecting some and rerouting others.[13]

One large group is almost brushed off into a bin labeled "non-readers," "first grade repeaters" or "opportunity class" where they stay for eight or ten years and are then released through a chute to the outside world to become "hewers of wood and drawers of water."

The intricate conveyor belt is seen to continue through high school and college, at each grade level a bit more selective and certainly less democratic in rejecting and accepting.

"The young people are inspected not only for brains and learning ability, but also for skin color, pronunciation, cut of clothes, table manners, parental bank accounts."

This conveyor belt hypothesis is supported in evidence by two tables which show that the greater the students parental income, the greater the likelihood he will go to college. It is also noted that I.Q. is not the vital factor in explaining variations in educational attainment. Other important findings were:

1. In high school there is a relationship between the students' socio-economic status and the curriculum in which he is enrolled and, when intelligence is held constant, the proportion of high school graduates that go on to college decrease with socio-economic status.

2. The type of school curriculum determines in part, the quality of education, for teachers and administration gives less prestige to vocational training programs than they do to the college-oriented courses.

3. Children from lower socio-economic groups are penalized in the social life of the school because they do not conform to the school's middle class standards.

Hollingshead analyzed the relationship of adolescents to the social structure.[14] The analysis involved 390 high school students; 345 who had withdrawn from school and 535 families of these adolescents.

Hollingshead concluded that opportunities for the attainment of desirable rewards and values (those held by the middle class) vary positively with individual's position on the social ladder.

The two explanations proposed are:

1. The socialization process in the lower class does not properly fit the adolescent for satisfactory educational and occupational adjustment.

2. The middle class adults in the school enforce their class values by "putting down" the lower class adolescents."

Criticism of these studies is that the relatively small communities analyzed are inadequate samples from which to make generalizations about all of American society. An important question was asked: Could difference in educational success be due simply to differences in educational sophistication among individuals from the various social strata? Because of their own college experiences and community positions middle class parents may have a better understanding of how schools operate, where to get information, with whom to speak in the academic bureaucracy, how to fill out applications, and so on.

A more recent analysis of the "climate of values" by Coleman suggests that (a) adolescents do not always reflect the values and attitudes of their parents; (b) social class alone will not predict the types of attitudinal orientations held by individuals; (c) educational institutions differ in respect to "social climates;" and (d) these differences will alter the impact of social class in respect to values, attitudes, and behavior.[15] Other studies suggest that there are norms of school culture which cut across class categories. Form and Stone found that adult attitudes and sensitivity to clothing varied sharply by social class identification. In Lansing, Michigan, Vener investigated differences in attitude toward clothing. Except for a feeling of deprivation with regard to clothing, there were no significant differences among the boys and girls from the various social strata in any of their age groups.[16]

Houser hypothesized that the family was not necessarily the relevant reference group for adolescents attitude toward minority groups.[17] This analysis indicated that within the adolescent school society there are relevant patterns of interaction which cut across the socio-economic categories characterizing the youths families.

A study of persons indicated that schools serve an allocating function in American society. The future status of the child in the adult social structure is determined in significant degrees by decisions made in school.

A study by Rosen attributes variation in achievement need and intensity to differences in the values held by parents in both social class groups.[18] Middle class parents are seen to place the greater emphasis on mobility and success, since their children are likely to embrace achievement-oriented behavior.

A Michigan State University study showed typical relationships between achievements and students social class backgrounds. Yet a sizable proportion of the youths from lower class families are excelling in school. Certainly factors other than those identified as social class are operating in determining school grades.

In summary, variation in reference group, motivation, self-perception, school "social climates," teachers and other adults expectation of the school and other factors may account for some differences in educational achievement and other school behavior which have been attributed to social class. Much more examination of such intervening variables is needed.

RESEARCH DESIGN AT WAYNE STATE UNIVERSITY

In August, 1965, Drs. Alan Bass and Reuben Barron initiated a project entitled: The Role of Social Reinforcement Parameters in Facilitating Trainee Motivation, Learning and the Performance. Their objectives were to specify a set of motivational conditions under which unemployed trainees from the disadvantaged population could be enabled to obtain maximum benefits from a job retraining program. It was postulated that the individual's self-concept was a crucial factor between the individual's past social reinforcement history and the amount of effort he is likely to exert for successful job performance. Thus, the research is aimed at determining what methods of dispensing social rewards will be most effective in changing the self-concept and, therefore, the subsequent job performance of job trainees.

The dependent variables in the experiment included level of past social Deprivation Abstract vs Concrete Rewards, 100 per cent vs partial rewards administrated by the authority figure.

It was assumed that trainees typically fail because lack of motivation underlying this assumption was the familiar observation that the trainees have poor images of themselves in terms of relevant vocational and educational skills. They had never been led to believe that they were particularly competent, skilled, or talented, and that they generally think of themselves as inept. Fear of failure has been shown in extensive psychological research to virtually guarantee failure. Having little experience with success the trainees have no reason to expect success.

THEORETICAL BACKGROUND

Recent experimental research suggests that a person's self-image (as measured by rating scales) may be effectively modified using relatively short-term social reinforcement techniques. (Hass and Maehr have shown that both positive and negative changes in self-image produced by laboratory social conditioning techniques persists at least as long as six weeks. Marlowe found much the same thing).

The work of Zigler, Gewirtz and Baer, and Ericksen have demonstrated that effectiveness of a given social reinforcer is a direct function of its past availability. Verbal reinforcers that have a praise connotation are more effective conditioners for the socially deprived than those emphasizing correctness.

Skinner's schedules of reinforcement are suggestive of the most effective way of bringing about changes in self-concept and improving subsequent job performance. The research proceeds to test these hypotheses of social reinforcement and the results are reported.

The analysis is incomplete but it does appear that praise of the person is more effective than praise of his task performance. Type and frequency of reinforcement yielded measurable differences. These will be reported in detail.

The current research is designed to measure the extent to which self-concepts and expressed motivation may be changed through direct interventions and social reinforcement.

RESEARCH DESIGN

Referring to the schematic design of the experiment, cell 2 of Group I contains 150 subjects who will receive the social reinforcement techniques developed for the Wayne study. This will be preceded in cell 1 by a series of scales designed to assess job prestige values and personal attainment measures. Personal problem areas, personality factors, and another occupational values inventory will be described later. In cell 3, subjects will receive a two-week period of intensive orientation to the various occupations which will include visits to the various businesses and industries. They will receive supportive services along with personal and vocational counseling during this time. This period will be followed by a period of smaller groups based upon the trainee professed interests again supplemented with social reinforcement.

During a final week of the period the trainees will spend a week at summer camp during which they will describe their experiences and formulate future goals.

In cell 4, trainees will receive post-scaling identical to the prescaling in cell 1.

Experimental Group II begins with cell 5, AYEP prescaling followed by cell 6, social reinforcement parameters. Cell 7 omits the summer experience and cell 8 is post-scaling.

Experimental Group III will receive the prescaling in cell 9; nothing in cell 10. Summer experience in cell 11 and post-scaling in cell 12.

The control group will receive only pre and post-scaling. All of the groups will be compared statistically.

INSTRUMENTATION

Mooney Problem Check List

Purposes: The essential purpose of the Mooney Problem Check List is to help individuals express their personal problems. The procedure is simple. Individuals read through the check list and underline the problems which are of concern to them, circle the ones of most concern, and write a summary in their own words.

There is nothing mysterious about the check list method of observing personal problems. A competent counselor can elicit an expression of a counselee's problems over a period of interviews. Observant leaders can infer the problems of a group from run-of-the-day behavior of its members and conversations on ordinary matters. By means of the Problem Check Lists, both of these slower methods of determining the problems of the individual or group can be accelerated, and previously overlooked areas needing attention can be brought to light. Thus, the usefulness of the check list approach lies in its economy in bringing the problems of the individual into the open and in appraising the major concerns of the group.

Design and Administration: The adult form of the Problem Check List, like other forms, is printed on a six page folder in a way that provided for ease of summarization by the counselor or research analyst. The present format has proved itself practical with hundreds of thousands of cases.

The Problem Check List

It is self-administering. All the directions needed are on the cover page. The language is simple and can be readily understood by

individuals of varying educational backgrounds. Usually the check list will be completed in 20 to 30 minutes, although some individuals may take as long as 50 minutes. Those who are slow should be given the opportunity to complete the check list, since they might be just the persons most deeply involved in their problems. The check list is constructed so that the problem areas run horizontally across the page, in groupings of six items. The areas, with the number of items in each, are listed below:

1.	Health (H)	36
2.	Economic Security (ES)	36
3.	Self-Improvement (SI)	36
4.	Personality (P)	72
5.	Home and Family (HF)	36
6.	Courtship (C)	18
7.	Sex (S)	18
8.	Religion (R)	18
9.	Occupation (O)	18
	TOTAL	288

The individual goes through the items in the check list, underlining the problems that are of concern to him. Most people, in answering the check list, do not discover the horizontal grouping of items by area. This is an important feature. Both students and counselors report that where groupings of items by area are obvious to the respondents, there is a tendency to skip entire areas that appear to be inappropriate without bothering to read the items, and to avoid marking items in areas that they feel have lower social acceptability--such as personality and sex. The format of the Problem Check List overcomes these difficulties and still presents a grouping of problems that is convenient for the counselor and the survey analyst.

THE SIXTEEN PERSONALITY FACTORS QUESTIONNAIRE

This test gives fullest information in the shortest time about most personality traits. It sets out to cover planfully and precisely all the main dimensions along which people can differ according to basic factor analytic research. The questions asked are indirect and the responses are treated as behavior not as valid self ratings. Three alternative answers to each item are provided for the subject. In order to supply a range of possible test lengths from which to choose, there are three forms: A, B, C.

Raw scores are converted to standard scores ranging from 1 to 10. These standard scores are plotted on a profile chart which graphically compares the scores and their interrelationships. To achieve a group profile, the arithmetic mean of the raw scores is computed, converted to a standard score and plotted on the group profile chart. Standard scores of 5 and 6 are considered deviant scores. Degree of deviance is empirically considered to be spaced in equivalent units.

Research data relevant to the Sixteen Personality Factor Test is now available in limited quantity. Apparently more data will be forthcoming. Some of the research data currently available is entitled, "High School Juniors Gifted in Science," "Sixteen Personality Factors Profiles of Happily and Unhappily Married Couples," "The Personality of Weight Lifters and Body Builders," "Social Casework With Families of Alcoholics," "Sixteen Personality Profiles of a Clinical Syndrome Group," and "New Prediction Possibilities for Vocational and Educational Counseling with the Sixteen Personality Factor." Other research is also available.

The Hatt-North Occupational Prestige Ratings

Description: A nationwide cross-section of Americans (National Opinion Research Center Sample of 2,930) were asked to rate the standing of ninety occupations. These occupations were chosen from a wide range of white collar and manual occupations.

Respondents were asked, "For each job mentioned, please pick out the statement that best gives your own personal opinion of the general standing that such a job has: 1. Excellent standing, 2. Good standing, 3. Average standing, 4. Somewhat below average standing, 5. Poor standing. I do not know where to place that one." Ranking the ninety occupations was made possible by a procedure devised to translate the percentage ratings on each of the jobs into a single general score. When the "Don't Know" answers were excluded, the scoring theoretically allowed a maximum of 100 points for any job receiving only "excellent" ratings and a minimum of 20 points for work that was unanimously rated as poor. The actual range became 33-96.

Study of Values: Allport - Vernon - Lindzey

The Study of Values aims to measure the relative prominence of six basic interests or motives in personality: the theoretical, economic, aesthetic, social, political, and religious. The classification is based directly upon Eduard Spranger's Types of Men (50), a brilliant work which defines the view that the personalities of men are best known through a study of their values or evaluative attitudes. Since it is undesirable for those who take the test to know too much about its theoretical basis beforehand, any mention or discussion of

these six values should be deferred until the test has been taken.

Hypotheses

It is hypothesized that trainees in Experimental Group I will show a significant difference in indicated problems between Pre and Post Scaling. Specifically, problem areas describes as questions 187, 188, 189, 190, 191, 19, 20, 22, 23, 68, 217, 218, 169, 170, 125, 77, 76, 75, 73, and 25 will be indicated significantly fewer times. It is also hypothesized that the mean number of indicated problems per trainee will decrease significantly.

Also in Group I it is hypothesized that trainees will change significantly in the following factors A, E, G, H, Q_1, Q_2, and that the movement will occur toward the high score description of the 16 Personality Profile.

Other hypotheses for Experimental Group I are that self-placement on the Hatt-North Occupational Prestige Scale will change and that it will move upward.

For the Allport-Vernon Profile of Values, it is hypothesized that value scores will change. The direction of change is not predicted.

V. COUNSELING

A. Success Experiences and Vocational Development

INTRODUCTION:

"Social dynamite" is the phrase frequently used to describe the situation among our unemployed, disadvantaged youth; a situation already serious and becoming more so. Many recent studies have shown a close correlation between youth unemployment and social problems of major proportions; symptoms of an increasing lack of vocational direction and purposeful job goals among our youth. Traditionally, the admission of youth to the adult world, their badge of belonging, is a job. Unfortunately, for hundreds of thousands of boys and girls this admission is denied because of discrimination, mental or physical disabilities, cultural and educational handicaps or other barriers to employment. These youngsters can look forward only to lives of drudgery and intermittent work. For them, the outlook is black. Life is empty, with survival the only incentive. It is in this social milieu that youth employment viz-a-viz vocational preparation and direction become important.

PURPOSE

It is hypothesized that there is a relationship between the individual success experiences in real life situations and the vocational development of disadvantaged youth as experienced by the trainees of the Mayor's Youth Employment Project of Detroit. The purpose of this paper is to explore aspects of success experiences in creating "self-esteem" and the relationship upon or toward a desirable state of employability.

There is a definite need for additional conceptual studies relating to individuals of lower socio-economic status. Leo Strole states, "Ultimately indicated here may be interventions into the downward spiral of compounded tragedy, wherein those handicapped in personality or social assets from childhood on are trapped as adults at or near the poverty level, there to find themselves enmeshed in a web of burdens that tend to precipitate (or intensify) mental and somatic morbidity; in turn, such precipitations propel the descent deeper into chronic, personality-crushing indigency. Here we would suggest, is America's own displaced-persons problem."[1]

SCOPE

The broad definitions commonly given to vocational preparation effectively limit the scope of this paper. The multi-faceted aspects of the field do not permit broad consideration of the development of total personality of the individual. While some background influences will be introduced, the dominant theme will be restricted to the effect success experiences appear to have in vocational preparation.

BACKGROUND

The population group for purposes of this study are the members of the Mayor's Youth Employment Project, and vary in age from 16 to 22 years of age (19.6 average age). The Project is primarily concerned with socially and economically deprived youths who are high school graduates but who for various reasons have been unable to make a successful transition from school to the world of work. This Project is an Experimental and Demonstration Program, federally fun-

[1]Leo Strole, Mental Health in the Metropolis -- The Midtown Manhattan Study, McGraw-Hill, 1962, P.23.

ded, to help these disadvantaged youth to become productive members of society through gainful employment, successfully completing the transition from adolescent to adult status. The majority of the trainees are Negro and come from homes in the inner section of the City of Detroit.

The term "vocationally prepared" or "employable" has many connotations, so it is necessary to establish a point of reference before proceeding. Many of the youth comprising the disadvantaged subculture are either unable to develop the vocational preparation necessary to maintain the identity they desire, or unwilling to accept the identity they possess with its resulting vocational limitations. Perhaps the main concept involved in vocational preparation is the establishment of a compatible and acceptable as well as realistic relationship between trainee aspirations and trainee abilities. These two factors are seldom in accord, which is to be expected. What is not expected and yet is more frequently true, is that a trainee's aspirations usually are considerably below his abilities. As a rule, they "feel" that they can function in a higher level and more demanding (and rewarding) job but also feel that there is little chance of their achieving it, or they are willing to compromise for considerably less. The problem, then, is to change the "feeling" from one of failure to one of success. This involves acquiring the job skills and exposing abilities while instilling success confidence through competent performance. The process is vocational preparation, and the result is employability.

If there is one overall characteristic that is common to all MYEP trainees, when they enter the program, it is failure. Failure in school and at home, failure in adjusting to personal problems and social situations, and primarily the failure to find some means of economic security. For Americans, the economic ethos serves as the bonding element for the integration of the multiple identities and roles of the individual and here lies the seeds of inadequacy and inferiority as well as those of self-respect and economic security. If an individual, through repeated failures, despairs of his skills or of his status among his economic partners, employability is impaired. "We see ourselves as others see us" becomes a self-fulfilling prophecy and the individual potential is not realized, for it is our contention that self-esteem and vocational competence is the accrued successful experience of the individual's ability to integrate all identifications, real or desired, with the vicissitudes of real life, with the aptitudes developed out of endowment, and with the opportunities offered in socio-economic roles.

THE PROBLEM

"Success confidence," another name for self-esteem, is not a simple task either to teach or to learn. It does not follow any external evaluation of individual worth. It is necessary to see ourselves through other's eyes but to accept this image only as a guide to be considered in establishing our conception of ourselves. Self-confidence thusly established, though it cannot indefinitely resist externally imposed degradation, may stand up rather well under attack.

In this sense, it is closely related to clarification of experience; if we do not understand clearly what we have done and what has happened to us, we have no true basis for self-confidence.

In adolescence, self-esteem is a crucial problem for there is, as yet, little experience to base it on, and that little is a thoroughly biased sample acquired in the home and the juvenile group. There is too little diversity of experience and too little experience of detachment to permit much objectivity and the individual, therefore, is extremely vulnerable to the feelings and judgements expressed by the persons and institutions of his environment. As a group, they lack reserves of self-esteem and confidence to sustain them under humiliating conditions, and they cannot easily assimilate an attack on their dignity or individual worth.

As a generalization, this has proven particularly germane with the MYEP trainees, 84% of whom were high school graduates in 1964-65. The high school institution still reflects and faithfully transmits the esteem or disparagement in which the community holds its students and their families. Lower socio-economic status students quickly come to perceive the school's concern with socio-economic status and consequently expect it to have no interest in them. It is here that many of them learn to accept the prevailing judgement of their worth. They accept and internalize this social verdict on themselves and proceed to lower their aspirations and job goals. The socio-cultural determinants of human behavior with particular reference to problems of identity and social role become even more complex when a racial factor is introduced. There still is a "double-standard" in America

for society's evaluation of individual social worth. An achieved evaluation is the determinant for the white population and an ascribed evaluation for the non-white population.

So the objectives of MYEP involve unlocking not one door but many. Of a slow, cumulative build-up of small individual victories here, strategic retreats with honor there, and understandable defeats along the way. Opening Doors for Troubled People, aptly describes the Project's role: "The individual who has not been prepared by experience and proper training to meet the many challenges and responsibilities of life in our complex society finds many people in the community commissioned, officially and unofficially, to help and guide him when he falters."[2] Their feet falter on many paths. Discrimination bars some of them from jobs for which they are qualified. Some simply need additional training and preparation. Others are unable to read and write well enough to even apply for a job, let alone perform one adequately. Some have never acquired the kind of self-discipline which is needed to work steadily. Many have not learned to find satisfaction and personal fulfillment through working. Some are unrealistic, holding out for jobs which are not available or which make demands they cannot meet. Some are qualified but cannot find jobs. Many of them live in congested city areas, surrounded by social disorganization, poverty, and despair.

Gerald Caplin reaffirms the importance of the role of experience and self-esteem. "It is worth noting," he states, "that what the

[2]David S. Shapiro and Leonard T. Maholick, M.D., Thomas Books, Springfield, Illinois, 1963, P. 62.

epidemiologists call 'host factors,' namely, the qualities of the members of a population which determine their vulnerability or resistance to environmental stresses, are made up of two groups of attributes. The first, including such attributes as age, sex, socio-economic class, and ethnic group, cannot be manipulated, since it involves, as it were, the factors of individual fate. The second, including such attributes as general ego strength, problem-solving skills, and capacity to tolerate anxiety and frustration, is currently fixed, but could have been modified in the past by altering the experience of the individual or his parents."[3]

It is in the area of secondary attributes where it is possible to be of greatest assistance to the trainee. In a work laboratory sense, both group and individual case histories within the Project appear to substantiate the relationship of success experiences--self-esteem--improving employability and vocational preparation. They reflect attitudinal changes, reorientation of self-concepts, and roles in and relation to the rest of society.

When trainee problems are encountered in the counseling process, a "pat answer" will not suffice. On the other hand, merely accepting the trainee and understanding the situation, while it may be cathartic, offers little in the way of a solution. The Project's basic concern, in this area, is the trainee's development and maturation through handling his own problems. A pragmatic course of action is followed whenever possible and appears to be effective in opening up various avenues of action and/or decision to the trainee.

For personal-type problems, the idea of "thinking with" the trainee and discussing a variety of possible solutions that the trainee may not have known, or making available information, seems to help in the process of making a decision that will tend to alleviate the problem. What this does in effect, is provide an "incubation period" during which the trainee may try a variety of approaches to solve a complex problem. An important fact here: While the problem is not yet solved, the very process of attempting a solution seems to help the trainee immeasurably by applying his own experience and values to a problem-solving situation. At last he feels he is doing something, he has the ball moving, he is to a certain degree the master of his own destiny.

In vocational problem areas, through the utilizing of the many and varied vestibule training stations, the trainee is physically placed in a situation where by doing and seeing, he is able to acquire the information and experience needed to make a rational decision. The resulting solution is their own solution evolved from their own experience and knowledge. The cumulative effect tends to make each additional problem more subject to solution and the trainee more secure in his own ability to meet and cope with the problem.

It appears that a multiple didactic approach to helping trainees solve problems provides the flexibility necessary to work in an area that has little in the way of research to offer significant guidelines. When the staff is not slave to a single method, it can be cognizant of the different stages of growth and maturation within the individual, and methods may be varied to suit the needs of the trainee

at significant points in the process of development. Most important, the staff then has the ability to act as a catalytic agent to start the problem-solving process of the trainee moving.

SUMMARY

Self-esteem or self-confidence and employability or occupational readiness appear related if not subject to correlation, especially inasmuch as the inverse proposition is both well established in social theory and documented in extensive research, i.e., loss of self-confidence results in poor occupational readiness. The case studies indicate not only the positive values of the "success experiences" but the equally positive values of the negative "failure experiences" for it is equally necessary to learn to cope with adversity without severe damage of self-concepts.

Success experiences, being instrumental in the creation of self-confidence, as an approach toward establishment of purposeful job goals and occupational preparedness would appear to deserve further consideration and experimental application.

B. PRE-COLLEGE ORIENTATION

> This E & D Program is designed not only to help Negroes to achieve equality of educational opportunity but to go beyond opening college doors to those with educational deficiencies associated with cultural deprivation and help them stay in college.

INTRODUCTION

Many colleges in the past few years have attempted actively to recruit qualified Negro students, but the supply of such students,

particularly as measured by the traditional methods of defining the term "qualified," i.e. scores on the College Board Examinations of their equivalent, is extremely limited. Negro students with relatively high college board scores have little difficulty getting accepted at good colleges and universities, but the great majority perform below acceptable standards on college boards. The major problem facing these Negro youth is the inequality of pre-college education, an inequality created and fostered by long years of segregated schools, a segregation both official and non-official, with the result that a relatively small number of Negroes of college age are adequately prepared for college. An effort should be made to locate, to help prepare, and ultimately to encourage more Negro students to actively seek and complete college training, particularly male youth.

A large percentage of Negro students who do enter college do not complete their education, and the main reason for their failure seems to be a weakness in the verbal skills of reading and writing, weaknesses which show up in the statistically significant differences between Negro and white students in the areas of verbal skills as measured in college board scores.

This six-week program would concentrate primarily upon verbal skills, reading, writing, general linguistic sophistication, and humanities; but it will also include mathematics, partly because mathematics, especially in its strong relationship to logic and organization of thought patterns, has a bearing upon such rhetorical skills as organization of ideas into logical and sequential patterns.

It is also felt that one of the greatest gulfs between high school and college subject matter exists here, and that six weeks of intensive study in mathematics will enhance the students' chances of success in college.

Enrollee Selection Criteria

To the greatest possible extent, enrollees will be drawn from the AYEP work-study program of TAP, but will possess the following characteristics:

1. High School Graduate
2. Four Basic Units of English
3. Two Basic Units of Mathematics
4. Three Units of the Social Sciences
5. Two Units of the Sciences
6. Show ability to do college work and have potential as well as proper motivation if given an opportunity to attend college.
7. Demonstrated financial need and disadvantaged by lack of cultural background.

(The AYEP work-study program is designed to prepare disadvantaged youth to meet the entrance requirements for college in addition to emphasizing the value of higher education and an awareness of the opportunities waiting the college-educated individual).

It is deliberately planned that the program be restricted to an essentially all Negro student body for what appears to be excellent reasons. For many Negroes in their teens the dominant white culture is meaningless. The consciousness of the present generation of young

Negroes has been shaped by segregation and the pejorative connotation of "blackness" which has been a part of the Negro's existence ever since his arrival in America. Therefore, an all Negro student body is thought desirable because it gives the program a direction which goes beyond simple acquisition of skills; it can aim at the intellectual stimulation of the Negro student by confronting him with himself and his situation through the medium of literature by Negro and white authors about Negroes and Negro-white conceptions of one another. In fact, those parts of the program which relate specifically to the strengthening of reading and composition skills depends upon the student's becoming involved in the deepening of knowledge about himself. Such knowledge would seem to be a pre-condition for his awareness of himself as a freely developing being in society. An important experimental aspect of the whole program is the way in which the books and poems to be read by the Negro students are selected to exert a power of attraction over his mind and his feelings, so that the development of reading and composition skills becomes a natural by-product of his desire to understand himself as a Negro and as a human being, and to express that understanding to himself and to others.

CURRICULUM PROGRAM

Language

The language course is designed to present the student with a descriptive approach to American English. This approach is viewed as the best way to eliminate misconceptions about the nature of the standard language. Language will be presented as a tool which enables

one to operate more effectively in the culture. Although the course will emphasize the practical rather than the theoretical aspects of language, enough linguistic theory and methodology will be incorporated to establish a systematic examination of English, spelling, punctuation conventions, syntax, and current usage.

This course, as will the others, will be shaped somewhat by the students' needs but will begin with a study of the history and structure of the modern dictionary through the use of a contemporary desk dictionary and a dictionary handbook. This examination will be related to a discussion of usage levels in contemporary American English, empirical conclusions about the distinctions between formal, informal, and non-standard usage. Effort will be made to show the students the flexible nature of language, the inappropriateness of such terms as "correct" and "incorrect," and the fact that standard American English is merely a socially accepted dialect imposed upon the total culture by a particular majority. A collection of essays on language will also be used and several papers will be assigned which require the students both to analyze particular language problems and to examine their own concepts about language.

Mathematics

The basic assumption behind the inclusion of mathematics in the curriculum is that a considerable gulf exists between the high school preparation of most students and what they will be confronted with in college. It is also felt that a number of mathematical concepts will have some relevance to rhetorical concepts. Certainly, logic, organization of thought patterns, and sequential reasoning, as well as an

ability to grasp abstract concepts, are common to both areas.

Course work will start with the natural numbers and the basic rules of operation with them. This will continue on the enlargement of this number system, first to zero and the signed integers, then to rational irrational numbers and finally to complex numbers. Number systems in various bases and operations for these systems will be studied.

The student's experience in arithmetic will be used to develop his understanding of algebra as a logical structure. The study of algebra will include exponents and radicals, factoring, linear and quadratic equations, the binominal theorem, synthetic division, obtaining real roots of equations of degree greater than two, solution of systems of equations including solution by determinants, the concept of function and an elementary discussion of limits and continuity. A review of geometry relative to the parallel axiom, ratio, proportion and area will be made. Also included will be a study of the essential topics of plain trigonometry--the circular functions and their graphs, basic identities, solution of trigonometric equations, and the laws of sines and cosines.

Finally, a brief study will be made of the conics. The basic equations of the circle, parabola, ellipse and hyperbola will be derived and a brief study will be given to their elementary properties.

No tests will be given through the six weeks of the course. However, daily assignments will be required of all students and a careful check will be made of at least three of these assignments per week, after which the papers will be returned to the students. The papers

will be used by the instructor as a means of keeping touch with the student's understanding of the lectures, and his difficulties. Problems that cannot be solved, or those missed most often, will be discussed in class.

Humanities

The objective of the course work in humanities is to involve the students personally in imaginative works of literature, to give them problems in handling abstractions, and to help them to communicate effectively in speech and writing. More specifically, it will attempt to heighten the students' awareness of the values and uses of accurate and sensitive reading and listening, and of clear and forceful writing and speaking. It will try to demonstrate to the students that these values and uses are in fact accessible to them because they already have within themselves--to various extents--the abilities to read, think, and communicate, and to convince them that these abilities can provide the basis for a better understanding of themselves.

As presently programmed, the students will be confronted with four works of literature, James Baldwin's Go Tell It On The Mountains, Ralph Ellison's The Invisible Man, Franz Kafka's Amerika, and Jean Genet's The Blacks. Two of these works are by Negro authors, dealing with the problem of being Negro in America; one is an imaginative examination of America by a foreigner; the last is an analysis of Negro-white relationships by a white author who is himself an outsider. In addition, films will be shown each week, in which parallels will

be drawn between the thematic concerns of the film and similar themes in the literature.

The classroom method will be lecture-discussion, with emphasis upon the latter. Instructors will try to show the students how to relate themselves, whenever possible, to the themes and ideas in the films and books. Reading and observation of detail will also be emphasized as a means for them to define for themselves the experience each work deals with, to apprehend the ideas and feelings which the work communicates through its treatment of such experience, and to preceive the relevance of that experience to their own situation.

Reading

Since one major problem facing each of the students will be an apparent difficulty in reading with sufficient speed and comprehension to compete with college work, much of which depends on such verbal skills, the reading part of this program is considered extremely important. Reading, of course, is a skill, and can only be mastered through constant and repeated practice. However, it is a skill that does not and cannot operate within an intellectual vacuum. The content of the material read is as important as the possession of the skill. One aim of this program is to increase the student's verbal and mathematical skills, but it is felt that these skills cannot be taught independently of intellectual content. Every effort will be made, then, to join the intellectual content of the course work to the mechanical skills required to absorb this content.

This course should be programmed only by a qualified reading specialist in conjunction with the instructors in the three academic areas. However, this is conceived as a course complementary and supplementary to the other courses in that a series of exercises and reading questions will be prepared from the regularly assigned reading in the other courses. Specially prepared reading examinations and vocabulary drills will be given, similar in nature to those which are given in standard verbal comprehension tests. Scores should be tabulated and close watch kept on rates of progress. Those who do not show satisfactory progress should be assigned to special clinical sessions with a Reading Specialist to diagnose and treat whatever individual difficulties are encountered.

Composition

Composition, like reading, is primarily a matter of mastering concrete skills, of being aware of certain conventions of the English language. On the lowest level, it consists of mastering the conventions of spelling, punctuation, and sentence structure. On a more advanced level it involves rhetorical considerations such as organization of subject matter, presentation and ordering of ideas, and considerations of style and diction. And, like reading, composition is intimately concerned with content. The ideas to be expressed must have some intellectual validity. It is the objective of the course to improve the student's ability to express himself in conventional English, and at the same time, to help him realize that he has something valuable to express.

Composition, then, is closely related to the language course, insofar as learning the mechanical skills is concerned; it is also closely related to the humanities course for expressive content.

Each student will be assigned to write one composition of about 500 words each week. The topics for compositions will be selected by the instructors in the subject matter courses (language arts, reading, and mathematics). After completion of a rough draft of the composition, the student will receive assistance with mechanical irregularities. The second draft will be discussed for matters of organization and style. The final draft of the paper will be turned in to the instructor for whatever subject the paper has been assigned. The instructor will read and comment upon the subject matter content. This approach, which provides the student with close supervision from the inception of the paper to its final completion, has the possibility of establishing in the student's mind the close connection between the acquisition of mechanical verbal skills and the ability to express one's self with clarity and precision.

Extra-Curricula Activities

As a supplement to the regular curriculum a few cultural and social events will be scheduled as well as some field trips.

Evaluation Techniques

No tests of any type will be administered during the operating period of the program, since it is felt that this program should be free from the normal testing and grading processes which characterize much of the students' previous educational experience, and which seems

to have given many of them a negative attitude toward the educational process. The only formal testing will involve the STEP tests (the Sequential Tests of Educational Progress) to be administered when the students first begin, and again during their last week. Separate STEP tests will be administered in reading, writing, mathematics, and essay. These tests are particularly useful for this program since they stress achievement of skills.

A quite effective informal measurement of achievement during the program can be gained through the essays required weekly of students in humanities, the language class, and on occasion, in mathematics.

Staffing

Three teachers and six teacher aides could adequately handle sixty students with the assistance of a Reading Specialist. Teacher classes would be held mornings with the afternoons spent in a teacher aide-tutorial situation on a 1 + 10 ration (teacher-student ration would be 1 + 20).

Rationale

This is a departure from the traditional educational structure to which students will have been exposed for twelve years and yet remain weak in certain areas. It is an attempt to provide these individuals with something entirely different in the way of an educational experience. It is an attempt to operate in an atmosphere of almost total freedom in which no external controls are exercised over the students, and in which the student is simply confronted with subject matter containing its own inherent interest. It is an attempt

to try, insofar as resources and time permit, to equip these individuals for college in a way which seems almost paradoxical; by facing them with an experience which when they get to college will bear little relationship to the situation prevailing there. But it is hoped that the six-week experience will whet their curiosity, stimulate their intellect, and help them to adjust to the reality of college through increased intellectual and personal motivation. One important aspect of the program is the attempt to make them realize that education is more than a matter of grades, tests, required class attendance, and token observance of formal requirements. It is hoped that they can be brought to see that education, to be effective, must spring from an internal desire, an internal quest, an internal curiosity.

VI. JOB DEVELOPMENT AND PLACEMENT

A. What Jobs; Job Finding vs. Job Fabrication

It is a demonstrable fact that jobs in a capitalistic society can be created only by a healthy and expanding economy. No social service agency or social movement can by their own efforts (save of course within their own structuring) brings into being new jobs. In every real sense, therefore, in a free enterprise economy jobs must be found because they cannot be fabricated.

The spark for the creation of a new job is the existence of a need, felt or real, for the performance of a service or the production of an item from which a profit can be realized. The role of the job placement function is to locate position openings since it cannot manufacture them.

B. Where Can Jobs Be Found

In the light of the foregoing it is clear that jobs are found where they exist. A placement function must be sensitized to as many sources of information for the presence of job openings as its collective capacities, energies, and imagination permit. All available and known avenues of communication in this area should be tapped. Classified ads, direct employer contacts, personal contacts, general economic indices, professional association affiliates, economic trend projections, technical journals, and liaison efforts with concerned counterpart functions are but a few of the means which should be and must be investigated continually if a job placement unit is to be characterized with by a success coefficient of the requisite magnitude.

C. Who Is To Find Them

1. Role of Project Staff:

Within the Adult and Youth Employment Project job placement is everybody's business. This is the way that it should be for no one person has a monopoly on contacts, knowledgeableness, and the physical energies necessary to cover the gamut of job openings that exist. While it is legitimate that the chief burden for finding jobs within the Adult and Youth Employment Project rests with the Placement Section this organizationally assigned responsibility does not exempt the rest of the staff from being alert to job opening possibilities. The immediate gratification propensities of the culturally disadvantaged demand that the name of the game be "earn and learn." To the accomplishment of this end the total efforts of the staff should be directed.

2. Role of Public and Private Agencies

It is trite but nevertheless true that the battle against unemployment among the culturally disadvantaged must be waged simultaneously on a number of far flung fronts. Only when there is a concerted show of response to the situation from the totality of the major segments within the community is there any hope for a significant impact upon the problem.

Detroit is fortunate in the respect that there has been both a community definition and a community response to the manifold factors that create as well as protract the extensiveness of the phenomenon

of unemployment among the "culturally disadvantaged." A few examples are offered in support for the above made point:

> "Mayor Cavanagh announced on Wednesday that he is pushing for a substantial relaxation of city testing and employment procedures to bring more unskilled and less schooled workers into civil service jobs. The mayor also promised to put pressure on policy makers in the Big Three auto firms and other industries to relax job requirements in certain areas. This will be done at an employment conference sometime in October he said....."[1]
>
> "Representatives of the Big Three auto firms will be asked to serve on TAP's (Total Action Against Poverty) employment committee to avoid repeating the recent Ford Motor Company decision to go out of state to hire people for its Wixom plant.
>
> TAP's policy advisory committee objecting to the Ford decision voted unanimously yesterday to ask policy making representatives of Ford, Chrysler, and General Motors to sit on the employment committee headed by Willis H. Hall, former general manager of the Greater Detroit Board of Commerce.
>
> Members of the advisory committee in taking the action said they felt that big industry in the Detroit area had a responsibility to help alleviate the hard-core unemployment in Detroit before going out of state to hire employees.
>
> The advisory committee was told by Michigan Employment Security Commission chairman, Malcolm Lovell that steps were already being taken to get industry to accept responsibility for training and hiring hard-core unemployed in the Detroit area.
>
> He said a conference on the problem has been scheduled for September 14 at the Rackham Educational Memorial. Hall added that his committee has been active in getting large industry to hire people from TAP areas.

He said that his committee was instrumental in obtaining jobs for 20,000 individuals in a six-month period this year, and 9,3000 of them were TAP area people."[2]

"More than 2,600 of Detroit's hard-core unemployed have found jobs as a result of a special two-week registration and placement program started in mid-September.

However, Malcolm R. Lovell, Jr., Director of the Michigan Employment Security Commission (MESC) said jobs still must be found for some 14,000 other persons registered during the program.

Lovell said 16,311 men and women registered for jobs as a result of the program. He said 9,105 were referred to job openings and 2,614 obtained employment.

More than 15,000 persons were rendered some type of employment services--placement in jobs, referral to jobs, counseling, testing for aptitudes or proficiency in certain skills.

The dual purpose of this project was to identify a considerable number of the hard-core unemployed and by exerting every possible effort to help them become job-ready."[3]

3. Disposition of Unfilled Job Orders

Within the Adult and Youth Employment Project an "S.O.P." has been evolved so that job orders that are received and cannot be filled are forwarded to a source where there exists more than a fair expectancy that they can be handled successfully. The aforementioned sources include: The Michigan Employment Security Commission, the On-the-Job Training component of TAP, the Neighborhood Youth Corps, and local university placement services.

The employer who placed the original job order is notified of the disposition of his request and thanked for having placed it with AYEP.

D. Barriers to Job Development and Placement

1. Age: Age is a barrier to job obtainment in terms of marginal extremes of youth and maturity. Even though the State of Michigan prohibits discrimination in employment because of age[4] the older applicant is still handicapped in finding a job particularly where there exists a checkered work history.

While there are kinds of employment opportunities for 17 year olds the more desirable entry positions in terms of pay and opportunities are open only to those who are at least 18 years of age. The younger applicant is also penalized for his lack of specific experience. While most employers demand that commodity, few seem willing to furnish it.

2. Medical Problems: The culturally disadvantaged are, also, the medically disadvantaged in terms of adequacy of information and care in the area of health. Both as a cause and a result substandard and non-nutritional diet coupled with a lack of economic means to seek are vicious dehabilitating agents. Many individuals in the population under discussion lack the physical stamina and energy necessary to create the requisite impression during a job interview or during a probationary employment period. This fact gives rise to claims of indolence, lack of capacity to learn, and insufficiency of drive levels. A number among this group also, do not possess the

psychological sets normally expected in the world of work, i.e., their attention spans appear limited, gratifications are of the moment, crystallized goals for self-direction are inadequate, and conventionally defined orders of general knowledge may be lacking.

3. High School Diploma: A lack of a high school diploma is decidedly a serious handicap in finding employment. Specifically, it is a problem for females seeking entry into clerical fields. For males more openings are available which do not necessitate successful completion of high school but this deficiency can and does constitute a "millstone" around the neck of those without it which plagues their entire lives. Not only are many job categories denied the non-high school graduate but even after obtaining a job vertical progression is often not possible. It may, therefore, be seen that the failure to complete high school is a double edged sword which cuts in terms of the more limited number of initial job opportunities as well as more limited advancement possibilities once a job is obtained.

The present age requirement of the Detroit Public Schools regarding the GED Test is 20 years. The Director of the Adult & Youth Employment Project and Dr. Carl Byerly, Assistant Superintendent, are making a concentrated effort to determine the feasibility of lowering the age requirement.

Thus, if this effort is possible, a number of youth will be able to gain a high school diploma via the GED, and, therefore, higher entry level jobs and perhaps promotional opportunities will be opened.

4. Criminal Record: One of the most formidable barriers to obtaining some jobs is the stigma of a police record. So few companies are willing to take a chance on those who have had difficulties with the law that a recent feature article in the Sunday Detroit News was devoted to the subject.[5] "Chrysler Corporation has become the first of the automotive 'Big Three' to knowingly hire convicted felons under a new program designed to give parolees and probationers a chance for useful productive employment. Four of the major local companies who accept employees without asking about prior criminal records are Great Lakes Steel Corporation, Evans Products Company, McLouth Steel Corporation and Revere Copper and Brass Company."

5. Ethnicity: "A current labor newsletter carried the bold headline, "Unemployment Rate at Nine Year Low"[6], citing the January, 1966 statistics of the U.S. Department of Labor report of unemployment in the nation currently at 4% or 3.3 million. This means that 40 out of every 1,000 workers in the labor force were actively seeking work and could not find it. As evidenced by this latest report, significant strides have been made during the past year when the adjusted jobless rate in January, 1965 of 4.8% edged up to 5% in February, and just eleven months later dropped to the new low of 4%. However, most of us concerned with the problems of minority group unemployment eagerly analyzed the current figures hopeful of finding some evidence of even a minimal decrease in the non-white figure,

only to discover that this rate has not only remained much the same over the past twenty years, but reflects an even worsening situation with the total number of non-whites among the 3.3 million unemployed as being 678,000 and still nearly double the national rate.

Making up less than 10% of the country's labor force, Negroes currently account for 25.4% of its unemployment. In 1947, the non-white unemployment rate was 64% higher than that for whites; in 1952, 92% higher, and in 1962, 124% higher; and as evidenced by the recent Labor Department report, is still climbing.

A summary article in a recent issue of Time presents this picture of the situation.[7] The employment situation has become incomparable better for the middle-class Negro and worse for the lower-class Negro. While unemployment among whites has been declining this year, and is now 3.3%. Negro unemployment has been climbing and is now 7.8%. This is primarily because the jobless rate in many black slums has soared to 25% and automation has eliminated a lot of menial and manual jobs traditionally held by lower-income Negroes. The overall figure nonetheless conceals the fact that countless job opportunities have opened for skilled and semi-skilled Negroes in the past few years."

E. Liaison With Employers

1. Introducing the Employer to the Project

Achieving employer rapport can be accomplished in a number of ways, i.e., visits to the facilities of the organization where entry

is being sought, telephone contacts, direct mail promotion, etc. There is little doubt that there is no substitute for personal meetings with an employer. This technique permits a greater flexibility of approach since those questions the employer really has about our project and its enrollees can be answered in the required depth and with the candor that is often necessary to dispel presently held bias.

2. Introducing the Client to the Employer

In each instance, where possible, the client should be introduced to the employer via the setting of a specific interview time which has been established by a preceding telephone call. The aforementioned contact should be utilized to give the employer the applicant's name and provide whatever pertinent data of a biographical nature that is required in addition to establishing the interview date and time.

Great care should be exercised so that there is no misrepresentation of the client's qualifications since in the long run the "truth will out" and more harm than good will have been accomplished.

F. When is Placement Effective?

1. First as Reality Orientation

One characterizing dimension of American Society is that it is work orientated. Much of ones social status derives from being employed as well as where and how one is employed. Save for a few socially sanctioned roles, such as students, housewives, and given categories of the handicapped, etc., work is the expected activity for everyone else.

It is debatable if one can fully share in our society in terms of prevailing value systems if one is not employed. Thus, to work is to enter the reality of the mainstream of American life.

2. Last, as the Payoff to Training

Training is most distinguishable from education in that the former is always specifically orientated to the preparation necessary for the performance of a task while the latter is globally pointed in terms of underlying principles.

While the task to be performed as the end result of training may be complex in that it is limited as far as goal attainment is concerned, rewards for training tend to be more immediate in realization than is true in the educational process and the greatest reward for job preparation is the obtaining of a job itself.

G. Follow-Up

1. How to Maintain Contact

While follow-up contact can be achieved in a number of ways one of the better means is a longitudinal study over a large enough sample to give meaning to the data collected. Emergence of patterns can best be seen over a population. An appropriate timing to conduct such an in-depth effort would be from six months to one year following the placement of the trainees involved.

2. What Follow-Up Service to Provide

It should be made known to each enrollee who leaves the program for positive reasons that an "open door" policy prevails and that if additional services are desired the attempt to provide them will be made upon request.

3. Feedback to all other Phases of Program

As part of the requisite communication net there should be as wide a circulation of follow-up data collected to as many individuals within the various functional areas as have a direct concern in the learning established.

PROJECT EXPLORATION

VOCATIONAL CHOICE

RATIONAL

Some authorities in the field of Vocational Guidance and Counseling have raised the question of the timing and method of one's choosing a vocation or occupation. Such authorities (Dr. Tucci, Dr. Super, and Dr. Ginsberg) have independently covered many aspects of this problem.

A recent study, Project Talent, developed by the University of Pittsburgh, has discovered that about 75% of a sampling of high school graduates (male) changed their vocational aspirations after graduation.

In some public school systems, a student is encouraged to make a tentative selection between the seventh and eighth grades. Other systems have done so earlier, while others have done so at a later grade level. It does not follow a precise pattern.

But prior to making a selection, even a broad general area, a student should know something about himself, his desires, tastes, ambitions and goals of life.

The student should also know something about the world of work--first hand.

His experiences must be in the flesh, not only through the media of books, magazines, TV and the beautiful color movies. This type

of "sheltered" acquaintances does not impart the other vital senses relating to feeling, smelling and hearing.

If these studies are valid, it then apparently indicates that a young student makes his selection at a poor time in life. The choice, once made, tends to narrow the base of exploratory experience. (In fact, it might be related to a student standing on a railroad track; the farther it goes, the narrower it appears to become until it reaches a vanishing point.) This is conceivably what might happen to an occupation. It might vanish in the five years it takes to get there.

There are other considerations that are part of the puzzle--the physical plant is one. Should large amounts of money be spent to make all high schools comprehensive? Or should/could programs be developed to give a broad base of knowledge in the fields of Industrial Education; then in the last semester/year of high school or a post-high school program, a high impact, short term, concentrated effort be made to assist the student in a real life experience in selecting an occupation?

In order to assist the youth, and those agencies charged with the education and training of said youth, the following objectives are set forth:

1. To stimulate the desire to continue school and/or further schooling.

2. To provide factual vocational information.

3. To provide related guidance and counseling on a day to day basis.

4. To develop a realistic test program for the youth involved. Immediate response.

5. To provide a wide variety of experiences designed to assist youth in selecting an occupation.

6. To provide a medical-dental program that might alleviate some of the road-blocks, imparing employability.

7. To provide a nutritional program designed to improve health and, therefore, the work capability.

8. To provide an in-depth counseling program aimed at personal problems.

9. To provide group experiences. Dialogue; interpersonal problems.

10. To transmit all data to interested and legally acceptable agencies.

A proposal to provide an exploratory Vocational Experience and the related knowledge in a Multi-Industrial-Business Related Complex, supplemented by counseling, guidance, and other supportive services for disadvantaged youth, high school juniors or seniors, from the inner-city.

I. Introduction

A key to understanding the behavior of youth in modern society is the paucity of meaningful economic roles for young people and their virtually complete segregation from the world of work until such time as they enter it at a comparatively late age. No separate tasks are set aside to be carried out by adolescents, nor is there

an institutionalized graduate increase of right and responsibilities corresponding with stages of physical growth. Apprenticeships and on-the-job training are limited, and generally the youth is schooled in artificial surroundings and segregated from the sphere of "real" work.

In our pre-industrial society, there was a general arrangement wherein young people, through apprenticeship type learning, gradually acquired more responsibilities and rights. The nature of a person's economic role was largely determined by his sex, then, the degree of involvement in economic tasks was determined and exacted his contribution to the collective struggle for survival.

In our present industrial society, sex and age are less significant criteria for the division of labor; instead, almost purely economic factors prevail. Tasks are tailored to the capacity of the human being at his most productive span of years. Consequently, the bulk of productive activities is carried out by adults, and increasingly, by adults within a prescribed age grouping which seems to be narrowing. By this process, adolescents are excluded from the production process. These conditions take on crucial importance in a society where the economic factor is the main criterion for the allocation of self-esteem in their own eyes, and social worth in the eyes of society. The impact of this is particularly great on the disadvantaged youth, especially as the number of unskilled jobs decreases. It is well as equal access to educational opportunities and other rights.

Perhaps one way of understanding this social movement, from the perspective of its youthful members, is to view it as an attempt to increase the availability of accessibility to roles which provide self-esteem and social worth.

II. Objective

This proposal has the two-fold purpose of exposing inner-city high school juniors and seniors to the multi-occupational world of work and to provide a systematically programmed collection of data to improve our knowledge of the magnitude and makeup of these groups and the factors preventing or limiting their employment.

The terms and conditions of observer-participant (employment) to be offered to the youth in this Exploratory Program, will comply with existing laws and regulations. The staff of the Mayor's Youth Employment Project will direct and supervise all aspects of the program.

The all-inclusive objectives of this program is to expose inner-city youth to an extensive body of occupational knowledge and experience at the crucial period (junior and senior academic years) when the majority of high school drop-outs occur. By providing them with a vocational objective or interest to which their remaining high school curriculum or post high school program may be functionally related, it is hoped not only to provide motivation for continuing in school, but by establishing a goal-interest to substantially increase their employability at the time of graduation.

A secondary but related objective of the program is to provide a source of earnings and savings for the youths to help them meet expenses when they return to school. (All data and recommendations will be forwarded to the participating school systems.)

An indirect but very important objective is to acquaint and weld more available resources in the community into a concerted attack on the problems of poverty affecting both youth and adults. Many private and public organizations have not participated in the poverty war due to administrative or personnel problems, lack of knowledge of the need, or simply because they have not been requested for the type of assistance and involvement which is within their capabilities. The programming of this project is designed toward involvement of hitherto uninvolved community groups.

III. Summary Description of the Project

In this project, the contractor will recruit, in cooperation with the Detroit Public Schools, and serve a number of male and female youths who are in need of the type of services and activities involved.

The contractor will further provide the following services and activities involved.

1st Period (2 Weeks)

This generally will be a pre-project orientation but with certain long-term objectives:

a. A thorough and complete briefing of the over-all objectives of the program with emphasis upon the experimental and demonstration aspects and the manner in which the trainees are involved and the values of their individual and collective contribution.

b. Collection of biographical and personal data.

c. Administration of a test program designed to improve our knowledge of the magnitude and makeup of disadvantaged youth and the factors preventing or limiting their employment and to be correlated, in the tenth week, with a "disbriefing" work-shop type retreat of one week duration.

d. Intensive guidance and counseling in both personal and vocational areas.

e. Organized athletics and small group activities.

2nd Period (2 Weeks)

Introduction into the world of work through medium of a large selected industrial complex.

a. Trainees will spend a part of each day or certain days of each week, whichever is most practical, as observer-participants within the industrial complex. Effort will be made to have these as varied as possible with rotation of the trainees during the period to increase vocational exposure.

b. The remaining portion of the time will be devoted to supportive services, personal and vocational testing and counseling and related activities under the supervision of the contractor and staff.

c. Out of these broad vocational exposures, every effort will be made to encourage a narrowing (positive or negative) of vocational interest for the third stage.

3rd Period (2 Weeks)

Enrollees will be broken down into smaller groups (approximately 5 to 20) for a similar assignment to smaller, specialized business enterprises, i.e., printing companies, hospitals, welding and/or fabrication shops, body shops, etc.

a. Enrollees will again be on a part-time basis in these enterprises with orientation toward knowledge of the special characteristics of small business. Rotation of observer-participant roles will be effected as much as practical.

b. The remainder of enrollee time will continue to be devoted to supportive services, vocational guidance and counseling with exposure emphasis on small business employment, apprenticeship and on-job-training opportunities.

c. Every effort will be made to assist in the crystallization of the individual's specific vocational interest for implementation of the next stage.

4th Period (2 Weeks)

Enrollees will be considered on an individual basis for assignment to a "vestibule-type" work station in accordance with his expressed vocational or occupational interest. This will be at the "grass-roots" level of our productive society and every attempt will be made to establish a one-to-one ratio between the enrollee observer-participant and a competent worker in his area of interest.

a. Enrollees will continue on a part-time basis in this work situation.

b. The remainder of the enrollee's time will continue to be devoted to intensive vocational guidance and counseling and clarification of job goals as related to educational opportunities.

c. A portion of MYEP enrollee time in the last week will be devoted toward encouraging and assisting the enrollee in contacting employers in his field of interest and himself securing his own observer-participant role for the following week.

5th Period (1 Week)

Enrollees to work part-time in work and with employers of their own choosing in accordance with their own concept of their vocational interest, aptitude and ability. This will be a close experience to securing actual employment on their own, assuming responsibility for their own choice and performance, and assessing themselves in these terms. Supportive and reinforcing guidance and counseling will continue throughout the week.

6th Period (1 Week)

It is anticipated that this will be a full-time period spent in a work-shop "retreat" setting, i.e. camp facilities, and will be devoted to:

a. A professional "de-briefing" correlated with the pre-project briefing to provide a body of knowledge concerning changes in work motivation and attitudes.

b. Assisting the enrollee to relate his summer experience and job-goal interests to his remaining years in high school, toward continued higher education, work-study programs, and the apprenticeable trades.

Throughout the project, for any high school graduates enrolled, the emphasis will be more directed toward continued education or training at the end of the project, and, if considered appropriate, enrollment on a tuition-paid basis with suitable institutions.

IV. Population Served

Youths eligible for this program shall be no less than 16 years of age, either male or female, and high school graduates or entering their junior or senior years in high school. From this population, the contractor will select those individuals for whom this project is the most suitable manpower development program currently available. Priority will be given to those youths of a disadvantaged background most likely to benefit from this pragmatic vocational guidance experience, a change of environment, the supervision of counselor, training in cooperation social relationships and work responsibilities, and beneficial guidance and counseling.

V. Number and Phasing of Participants

The contractor agrees to recruit and serve up to two hundred (200) male and female youths, with the Detroit Public Schools cooperation in accordance with the following schedule:

Pre-project orientation	June 27 - July 8
Industrial Exposure	July 11 - July 22
Small Business Exposure	July 25 - August 5
"Vestibule" Exposure	August 8 - August 19
Individual Job Choice	August 22 - August 26
Post-project "de-briefing"	August 29 - September 2

Return to high school September 6, 1966.

VI. Selection of Participants

The contractor is responsible for recruiting and screening the specified number of youths from the pool of applicants. The recruitment shall not be based on discrimination with respect to the race, ethic origin, or religious creed of applicants. Screening procedures shall be adequate for determining the vocational aptitudes, capabilities and interests of the youths; and for determining that this project is the best potential course of action or program available to the youth at the time. Factors to be considered include the economic status of the applicants; records of previous behavior or social adjustment; school record and/or recommendation; the home environment; and physical condition.

Recruitment will be directed to, but not limited to, the inner-city high schools of the City of Detroit.

VII. Pre-Project Orientation Study

In order to develop the type of sophisticated research needed, Dr. Allen Bass of Wayne State University will conduct a Pre-Orientation Study. with the Project Group and a like control group. The information gathered will be put on memory cards and will be used in relation with the Post Project Study.

Dr. Bass and his staff will work with the Test Specialist of the Mayor's Youth Employment Project in the design and implementation of the total study.

VIII. Post-Project Orientation Study

At the conclusion of Project Exploration, a Post Project Study will be instituted by the staff of Wayne State University and the staff of MYEP. This will be undertaken during the "Retreat." The information and projections will be included in the Final Report.

IX. Staff Supervision and Involvement

A summer staff will be employed to be the Counselor-Coordinators. It is hoped that a number of the last summer staff (Project Growth) will be able to return. The coordination will be through the Detroit Civil Service Commission.

The permanent staff of MYEP will give direction, supervision, and full support to Project Exploration. These services to include:

Director

Assistant Director

Senior Job Training Supervisor (Liaison)

Senior Counselor & Staff

Senior Test Specialist & Staff

Senior Job Development & Staff

Plus the participating community resources and the staff of Total Action Against Poverty.

X. Administration of Pay and/or Allowances

All funding is processed through the City Controller, City of Detroit.

XI. Vocational-Related Services

For those enrollees who have expressed an interest, demonstrated desire, or based upon educational background, seek to gain entrance to higher educational opportunities (post high school), provisions will be made to enroll them in one of the post high school programs in the community. This could be during or immediately following Project Exploration.

Counselor-Coordinator contact would be maintained throughout this phase.

Also, it might be desirable to have the interested trainees "audit" several classes at the University level without enrollment.

XII. Terms and Conditions of Enrollment/Employment

The enrollees will be selected from the inner-city schools, private or public, with their cooperation.

In these schools, prime consideration will be given to the potential "drop-out." The junior, senior year of a high school program seem to be the end of the line for the drop-out. The age factor 16 - 18 years old must be considered, but not the over-riding criteria. It seems likely that the age levels per grade are possibly higher for disadvantaged youth.

XIII. Insurance

The contractor will attempt to provide adequate accident insurance coverage for all enrollees during the entire period of enrollment at no expense to the enrollee of both an occupational and non-occupational nature. Provisions will be made to enroll the youth under the Workmen's Compensation Act.

XIV. Records and Reporting

The contractor shall keep sufficient records to adequately document the experience of this program. Furthermore, he shall be responsible for developing an information collection and retrieval plan which will provide the necessary detail for preparing periodic reports, special reports, final report, and such other reports as required by the funding or allied agencies.

BUDGET

Project Director (CSA)	8,793 (1/3)	=	$ 2,931.00
Counselors-Coordinators (Jr. CSA)	7,670 (1/3) X 8	=	20,453.28
Typist	5,547 (1/3)	=	1,849.00
			25,233.28
Benefits 21% (Approximate)			5,298.98
			30,532.26
Bus Transportation	500.00		
Mileage 9 x 1200 x .10 =	1,080.00		
Retreat	3,500.00		
WSU Consultant	2,500.00		
Tuition	1,500.00		
	9,080.00		9,080.00
Training Stipend $24.00 x 10 wks x 200 trainees			48,000.00
Office Operation			500.00
Insurance - Workmen's Comp.			400.00
Insurance Estimate			3,000.00
			91,512.26

APPENDIX B

RECEPTION OF RECOGNITION

ACKNOWLEDGEMENTS

The Reception of Recognition is to honor those individuals and institutions who have assisted in developing the trainees of today into the citizens of tomorrow.

The Mayor's Youth Employment Project is not only grateful for past performance, but, this reception is a living example of the co-operation existing in this city.

Without the many contributions of a variety of institutions and their concerned representatives, this reception would not have taken place.

The G. P. Johnson Company
The Detroit Public Schools
Wayne State University
The City of Detroit
The Mayor's Youth Employment Project Staff
The Technical Advisory Committee

Special thanks to the General Motors Corporation for their support in this reception.

Pub Date - Mar68 48p.

*EDUCATIONAL CHANGE; *EDUCATIONAL INNOVATION; *VOCATIONAL EDUCATION; STATE PROGRAMS; NATIONAL SURVEYS; EDUCATIONAL IMPROVEMENT; *TECHNICAL EDUCATION; *PRACTICAL ARTS; PROGRAM DEVELOPMENT

A project to summarize and publicize new developments in vocational, technical, and practical arts education was authorized by the American Vocational Association in December 1963. Information on federally-aided programs of vocational and technical education in local public schools, public area schools, and supportive services in various state agencies and institutions is given. Local and state innovations are briefly described under these headings: (1) Policy, Policy-Making, and Planning, (2) Objectives and Evaluation, (3) Definition and Needs of the Clientele, (4) Organization and Administration, (5) Revision of Programs and, Procedures, (6) Provisions for Personnel, (7) New Funds and Facilities, (8) Research and Development, and (9) Public Information and Relationships. Excerpts and annotations from state and local reports describe progress and activities in the several states. (EM)

NEW **DESIGNS** IN VOCATIONAL, TECHNICAL, AND PRACTICAL ARTS EDUCATION IN THE PUBLIC SCHOOLS

The American Vocational Association reminds readers of this publication that the information contained in this publication was gathered and compiled over a six month's period. It is an almost impossible task to present data that is completely accurate at the point of publication. The materials presented here were prepared and submitted by State Directors of Vocational Education and represent the facts existing at the time the information was submitted.

Generally, this publication is an attempt on the part of the authors to show the change and progress that has resulted in vocational education since the passage of the Vocational Education Act of 1963. The authors, in the Forsword, spell out certain limitations of the report.

FOREWORD

A project to summarize and publicize new developments in vocational, technical, and practical arts education was authorized by the Committee on Public Information of the American Vocational Association in December, 1963.

Reports issuing from the regional studies involved in the project were published in the American Vocational Journal in December, 1964; November, 1965; April, 1967; and December, 1967.

Data from the northeastern and middle western states were gathered in 1966 and 1967. New data from 25 southern and western states were sought in 1967 to update the earlier reports.

Reports from the western states were obtained and summarized by Dr. Allen Lee, now Research Professor, Oregon State System of Higher Education; those from the Middle West by Dr. J. Robert Warmbrod, Associate Professor of Agricultural Education, University of Illinois; those from the northeast by Dr. John A. Roeder, Associate Professor of Vocational-Technical Education, State University College, Buffalo, New York; those from the South by Dr. H. M. Hamlin, Consultant, Center for Occupational Education, North Carolina State University. This manuscript was prepared by Dr. Hamlin.

Credit is due Dr. John K. Coster, Director, and the staff of the Center for Occupational Education, North Carolina State University, for assistance in securing data and preparing the manuscript for publication.

The reports from the states were most commonly made by state directors or persons they designated. In some states, their reports were supplemented by teacher educators.

The new designs reported are those in the local public schools, the public area schools, and the supportive services provided in the state divisions of vocational education and the colleges and universities. Much larger programs of vocational and technical education outside the public schools are not included. Developments at the federal level are reported only as they have impinged upon the states.

The report is further limited because it deals only with vocational, technical, and practical arts education and most states have reported only developments in the federally-aided program of vocational and technical education. It omits new designs in many other forms of education which contribute to occupational choice, competence, and advancement.

A summary derived from the information available to the writers will necessarily be unfair to the programs in some states. Programs described as new in some states may be old in other states. The working definition of a "new design" had to be a design new to the state reporting it. The space and attention given each state varies to some extent with the information the states provided, which varied from meager to abundant. The cooperation of those who furnished it exceeded even our high expectations and is much appreciated.

The publication has been prepared primarily for persons outside public vocational, technical, and practical arts education. It is hoped that it will also be of value to the profession and that professional vocational educators will aid in disseminating it to educators of other types and especially to influential lay citizens.

The message the publication brings is one which the Committee on Public Information has believed to be needed since the Committee was formed in 1959. The false stereotypes of vocational education reported in 1959 to be widely held are far more misleading now, if they still persist, in view of the tremendous developments of the past few years, some of which this publication reports.

A similar message is conveyed by a recent publication of the Bureau of Research, U. S. Office of Education, entitled New Directions in Vocational Education. Case Studies in Change. This booklet reports new designs in five situations: the bay area of California; Georgia; Warren, Ohio; Phoenix, Arizona; and Quincy, Massachusetts.[1]

SUMMATION AND INTERPRETATION

The following pages seem to indicate that change in vocational and technical education is rampant over the land. Certainly there has been no five-year period in which there has been so much change in this field as there has been from 1963 to 1967. The evidence in this publication, especially that concerning research and development, implies changes during the next five years far greater than those reported for 1963-67.

Yet much remains unchanged or little changed. This is a publication about new designs. Programs whose worth has been proved are continuing and growing. Not all ineffectual or misguided programs have been eliminated.

Our commitment to occupational education for all. Perhaps the most significant recent development has been wide public acceptance of the concept that everyone is entitled to appropriate occupational education, that is, education designed to contribute to occupational choice, competence, and advancement, provided at the times in his life when it is needed. We are gradually spelling out and implementing the implications of this commitment, but we have far to go. Some of the unanswered questions are these:

1. Could occupational education be designed that is appropriate for all students in the elementary schools, the junior high schools, and the senior high schools?

2. How are occupational education programs in the local schools, the area schools, the colleges, and the adult schools to be articulated?

3. What new provisions should be made for occupational education for the underprivileged and dissident in our society?

4. What additional financing of occupational education is needed? How should the funds be raised? How can the funds now available for it be better spent? What financial assistance is needed by students?

5. For what portion of occupational education should the public school system be responsible? How much should be done by other public agencies and by private agencies? May we expect increasing shifting of responsibility from private to public agencies?

6. Can crash programs for out-of-school youth and adults with no occupational education or limited occupational education be reduced as the public school system functions more adequately?

7. Can we come to regard occupational education as one of many types of education contributing to well-rounded human development and integrate it with the other types of education which also contribute?

8. What kinds of vocational and technical education are we going to develop for the rapidly increasing numbers of women employed outside their homes?

9. What changes in programs are implied by high and increasing rates of migration? By what steps shall we get away from vocational education oriented only toward a community?

10. Can we use vocational education more extensively to reduce welfare rolls?

11. How can we prepare children and youth to deal more wisely with the increased complexity of occupational choice with some 30,000 occupations available to them and opportunity to migrate to any area where a particular occupation is practiced?

12. Should the public schools become responsible for seeing that junior and senior high school students get the occupational experience they need if their development is to be balanced and sane?

13. Can we devise programs that will induce more youth to remain long enough in school to qualify for the better occupational opportunities?

14. Can we lift to occupational competency the millions of adults who have left school without occupational preparation?

15. Can we recruit and train enough competent professional personnel to provide the vocational and technical education needed?

16. Can we become sufficiently proficient in research and development to provide the concepts, principles, and practices to guide change and innovation?

Basic to all these questions and to many more is the question as to whether we can evolve the public policies and improve the methods of public policy-making to secure the kind of occupational education we might have.

Factors outside the states which influence national trends. This is a report from the states. Outside influences upon the states have been noted incidentally. It seems desirable to elaborate upon some of them.

Federal legislation is likely to play an important and perhaps a critical part in the future development of vocational and technical education in the states. The report of the first five-year evaluation of programs aided by federal funds will go to the Congress in January, 1968. The mood of Congress will determine what will be done.

Recently it has been interested in vocational education to relieve slum conditions, reduce juvenile delinquency, and cut unemployment.

National organizations of business men, industrialists, laborers, and farmers will have much to do with the future development of occupational education. The Education Commission of the States has become interested in vocational education. The Council of State Governments and the Council on Intergovernmental Relations influence state legislation. The American Vocational Association, the American Association of Junior Colleges, the American Association of School Administrators, the National Association of Secondary School Principals, the National Education Association, the American Federation of Teachers, the National Schools Boards Association, and the National Council for Support of the Public Schools will affect decisions. Interstate cooperation in providing vocational and technical education is developing through regional associations such as the Southern Regional Education Board. The accrediting associations can be expected to increase their influence over vocational education.

The educational program of the Armed Forces, described recently by Secretary McNamara as the largest educational enterprise in the world, cannot be ignored in planning the future of vocational-technical education since much of it is in vocational and technical education.

Private business and industry are likely to expect more and better vocational-technical education in the public schools. As they transfer a part of their responsibility for training to the schools they are also developing a strong interest in providing equipment and aids for school programs.

Much will depend upon state and local reactions to federal gestures in the financing of vocational and technical education. This report shows the states and the school districts stimulated to increase their own spending by the increase in federal funds. What would happen if the federal government, hard-pressed for funds for other uses, would cut its expenditure for vocational education?

SUMMATION. The report indicates increased vitality in public vocational and technical education in the states and their subdivisions. There is a healthy partnership of the local, state, and federal governments in providing it which has seldom been achieved in other governmental affairs. There is a new public awareness of the importance of this type of education. Funds are being made available for it as funds are being withheld from some other types of education.

The provision of adequate occupational education for all of our population is enormously complex. All of the agencies now providing it are likely to continue to function. Taken together, they are still inadequate. Conflicts among them will have to be resolved. Gaps will have to be filled. It is predictable, however, that the public schools will have a larger part than they have had and that the resourcefulness and initiative reflected in this report will continue to operate in effecting changes that are needed.

Perhaps the wisest comment that can be made regarding the future

of the entire educational system is that of Dr. Kenneth Boulding who says that it should "plan for surprise".[1]

---

II

NEW DESIGNS REPORTED

1

Policy, Policy-Making, and Planning

The Vocational Education Act of 1963 sparked policy and program revision in the states and the school districts throughout the nation. The Act encouraged the provision of modern vocational and technical education for four groups and provided funds to aid in providing it. These groups are:

1. Persons attending high school
2. Persons who have completed or left high school and who are available for full-time study in preparation for entering the labor market
3. Persons who have already entered the labor market and who need training or retraining to achieve stability or advancement in employment
4. Persons who have academic, socio-economic, or other handicaps which prevent them from succeeding in the regular vocational education program

The Act also provided substantially larger funds for the construction of area vocational school facilities and some increase in funds for other special purposes. Ten per cent of the new federal funds were to be used for research, development, and training in vocational and technical education.

South Carolina reports that "the 1963 Vocational Education Act has done much more than provide funds to expand vocational education in South Carolina. With it have come new concepts, new opportunities, new challenges, and new inspirations. It has brought the entire vocational program into focus with job opportunities and the need for providing our people with marketable skills, not only to improve the welfare of the individual but to promote the economic development of our states throughout the nation."

Florida capsules recent developments in these terms: "Progress in vocational, technical, and adult education in Florida since the passage of the Vocational Education Act of 1963 has been increasingly based upon program innovation, sound management and administrative practice, concern for the education of all students, and understanding of the need for objective bases in decision-making."

Policy-makers, administrators, and vocational educators seeking the implications of the new federal legislation were made very conscious of the limited or negligible services provided for certain groups specified in the Act. Antiquated policies were frequently reviewed and revised. New organizations were set up. New programs to serve new groups were financed, staffed, and provided with facilities.

The following statements provide only samples of changes in policy and policy-making.

In its Community College and Occupational Education Act of 1967 the Colorado Legislature authorized "coordinated development of occupational education programs to the end that the State of Colorado shall have a complete and well balanced occupational and adult education program available to the people of Colorado at all educational levels."

The New York State Board of Regents has established this goal: "To provide appropriate occupational education for state residents of varying ages, education and needs, wherever they live."

North Carolina, like many other states, is "committed to providing opportunities for vocational and technical education within reasonable commuting distance of all its citizens."

The Oklahoma constitution, which had stated that "the Legislature shall provide for the teaching of the elements of agriculture, horticulture, stock feeding, and domestic science in the common schools of the State", has recently amended it to provide vocational-technical education school districts.

West Virginia has a new "Comprehensive Education Bill" providing special funds to upgrade any part of the curriculum including vocational-technical education.

Delaware has new legislation for vocational-technical education and a substantial increase in the funds for it.

A long-range plan for vocational education in Utah is being developed following a comprehensive state survey.

Accepting the recommendations of a position paper on vocational education by the Montana State Board of Education, the State Legislature in 1967 increased the biennial appropriation for it by more than 800 per cent.

North Carolina is one of many states which has collected extensive manpower data by labor-market areas and by special fields within vocational education, charted economic trends, and surveyed employment and unemployment to provide data for replanning programs.

California has allotted a substantial part of its new state and federal funds to projects proposed and initiated by local school districts.

The 1963 Act required state advisory committees for vocational education. Some states have established committees for the first time; others have reconstructed and reactivated existing committees. Montana has made its committee a permanent committee of the State Board of Education to meet with the Board periodically and report to the Board at statutory meetings.

Many other changes resulting from changed policies, new methods of policy-making, and increased attention to program-planning will be reflected in development reported under the headings which follow.

Objectives and Evaluation

Recently there has been much questioning of the objectives of public vocational and technical education and much attention to improved means of evaluating the contributions it is making.

Thirteen Midwestern Governors resolved in August, 1967, that "the public education agencies administered by state and local governments be directed to give more emphasis to the preparation of youth and adults for entrance into and advancement in employment" and that "the educational program be restructured so as to prepare individuals for entrance into a job and for opportunities for continuing education."

In Utah "the State Board recognizes that vocational education is much more than the teaching of skills, tools, and materials. Emphasis is also being given toward improved counseling, attitude development, selection of realistic personal goals, and improvement in the types of interpersonal relationships so essential to job retention and promotion."

The State Board in Montana has included the following in a list of the objectives of vocational education: "To provide opportunity for students to develop human relations skills and attitudes."

Utah indicates a trend toward the attainment of measurable skill levels rather than emphasis upon completion of a prescribed number of class hours of instruction.

In Florida the staff of the State Division of Vocational Education has restated its beliefs regarding the purposes, and objectives of vocational and technical education. The general objectives stated are being translated into operational objectives, purposes, and goals by the respective vocational services. There have been similar developments in many other states including Georgia, Illinois, Kentucky, and Pennsylvania.

Colorado, Kentucky, and New Jersey are cooperating with the Center for Vocational and Technical Education, Ohio State University, in the development and application of criteria for the evaluation of state programs of vocational education.

Texas requires the local schools to make evaluations of the quality and effectiveness of vocational education and has developed forms for their use.

In Mississippi a system of self-evaluation has been developed by the Research Coordinating Unit. Each vocational teacher in the state has evaluated himself. A committee of local teachers and administrators has evaluated each program.

North Carolina is in the second year of a comprehensive, five-year review and evaluation of vocational education in all of the administrative units (school districts) of the state. Thirty-four administrative units are being reviewed in 1967-68.

Montana and Oregon are stressing the need for continuous evaluation and redirection. Oregon proposes "application of a comprehensive evaluation system, relating data regarding human resources and job opportunities to existing and needed programs."

Florida has developed a format for use by the counties (school districts) in assessing program strengths and deficiencies, utilizing information and data already available. There is exploration also of a method by which cost-effectiveness factors may be determined.

An evaluation of Utah's "Pride of Performance" program resulted in its discontinuance. The Utah Research Coordinating Unit is now evaluating manpower schools at Salt Lake City and Ogden.

Georgia has studied the 1967 graduates of its area schools. It has discovered that all of them had been placed, 61 per cent immediately on graduation. Seventy-one per cent were in the occupations for which they had trained; 10 per cent were in related fields. Their weekly earnings were distributed as follows.

Earnings	Per Cent
Under $50	8
$51 - $69	36
$70 - $100	38
$101 - $150	16
Over $150	2

Their distribution by occupational fields in which employed was as follows.

Skills trades and service occupations	1,349
Office occupations	1,122
Technical occupations	477
Health occupations	334

A study of the vocational graduates of the past three years is under way in Oklahoma. Records of those to be trained in the future will be added to provide a computerized system. New Mexico and Washington are also developing computerized follow-up systems.

Florida is developing accreditation standards for post-secondary vocational-technical schools other than junior colleges. The project is shared by the Division of Vocational, Technical, and Adult Education and the Accreditation Section of the State Department of Education. Proposed standards have been reviewed by local administrators and field-tested in three schools.

The North Carolina Department of Community Colleges has issued a comprehensive guide for the self-evaluation of individual community colleges and technical institutes which gives much consideration to vocational and technical education.

Guides for the evaluation of area schools are being developed by the Southern Association of Colleges and Schools and the Oregon State System of Higher Education.

Those mentioned are only samples of evaluation efforts, now widespread.

Definition and Needs of the Clientele

Analyses of the clientele now served and the needs of those unserved have been common. Estimates of the requirements of staff, funds and facilities to serve a growing clientele have frequently been made.

In Oregon the enrollment in vocational education secondary programs had grown to 12,000 in the forty-six years prior to 1964. From 1964 to 1967 they increased to 24,820, while post-secondary enrollments grew from 2,166 to 4,703. It is now estimated that enrollments in vocational programs in grades 11 and 12 will be 39,975 in 1975 and that enrollments in vocational-technical programs in the community colleges will increase to 15,216 in 1975.

From 1964 to 1967 enrollments in vocational and technical programs in Florida increased from 250,000 to more than 300,000.

South Carolina has had an increase of 6,504 students in vocational agriculture from 1963-64 to 1966-67 in spite of a decrease in departments and teachers.

The major developments can be summarized under the following headings.

1. New definitions of the clientele to be served
2. Determination of the needs of the clientele
3. Provisions for special groups
4. Financial aid for students

New definitions of clientele. The New Jersey Division of Vocational Education has become concerned with occupational education "from the kindergarten through graduate school."

The North Carolina Director of Vocational Education has stated that "most of the major changes now taking place are influenced, in no small part, by the Act that proclaims it to be national policy 'that persons of all ages in all communities . . . will have ready access to vocational training or retraining which is of high quality.'" In keeping with this national goal, North Carolina is committeed to "providing vocational and technical education opportunities for (1) high school youth available for full-time study; (2) high school graduates and dropouts available for full-time study; (3) employed adults who need and are interested in upgrading themselves vocationally in their present jobs or retraining for different jobs; and (4) persons who need remedial or special education as a prerequisite to the pursuit of their regular vocational training."

It is expected that in Mississippi within the next two or four years the public schools and colleges will be providing the prevocational and vocational education required to meet the needs of all the people.

The Montana State Board of Education has declared its intention to "provide vocational-technical opportunities so all Montana citizens may have the opportunity to develop competencies needed for successful entry and advancement in the world of work."

Oregon has discovered a need to provide vocational education for 50 to 60 per cent of the State's high school students.

Georgia has been studying the clientele served by its area vocational-technical schools. It was found that the average age upon entry into these schools is 19 and that 95 per cent of the students are between 18 and 21 years of age. Approximately 90 per cent are high school graduates; 20 per cent have attended college.

Determining needs of the clientele. The highest demand for employees in Utah is in the clerical occupations; one in five of the new jobs is in these occupations. A survey discovered 68,000 jobs for white-collar workers and 45,000 for blue-collar workers. Twenty-five per cent of the jobs were in professional, semi-professional, or technical occupations. A study is being conducted in cooperation with the Utah Department of Employment Security to provide quantitative requirements in eight paramedical occupations to 1970. There is awareness in Utah of the need for increased employment opportunities and for more adequate knowledge of the nature of employment requirements.

The Oregon Department of Employment has been given special funds for the development of statewide employment data to be distributed to the schools.

New Mexico is conducting a survey of manpower needs in 44 communities with populations over 2,000. Yearly recurring surveys of this type by the Research Coordinating Unit are planned.

Texas has summarized 240 local or area occupational surveys.

Concern about youth unemployment and displacement of workers by automation is reflected in new programs.

Provisions for special groups. Mississippi has under way a program to extend vocational and technical education to the poor. The Delta with large numbers of unemployed is a major target area. The State has many new programs to relieve poverty.

Students are consciously prepared for migration in the area technical school at Paintsville, Kentucky, and a majority of the graduates leave the State. Arizona is using the manpower program to train migrant workers.

The Center for Occupational Education, North Carolina State University, conducted a research seminar in 1966 dealing with occupational migration and mobility with persons from twenty-one states, coast to coast, in attendance.

The states with large Negro populations are generally concerned about new employment opportunities for Negroes and the training that would make possible their employment in higher-paying occupations.

New Mexico has established five new departments of vocational agriculture in areas populated primarily by Indians.

Mississippi is proposing to offer prevocational education for all boys and girls in the junior high schools. New Jersey has a two-year project called "Technology for Children." A guidebook for teachers has been provided entitled "Increasing the Vocational Awareness of Fifth and Sixth Grade Pupils."

Nevada has a special appropriation of $250,000 for 1967 to improve and extend vocational-technical education for high school dropouts and special-needs students. Oregon is conducting a major demonstration project for dropouts and near-dropouts that is to serve 20,000 over five years with "personalized educational programs." Texas enrolled 4,179 in 1966-67 in an occupational training program for persons disadvantaged educationally and otherwise. Mississippi conducted thirty classes for students with special needs in the same year and found them "very satisfactory."

In the North Atlantic states and elsewhere courses for adults are being provided generously to train, retrain, and upgrade workers.

Montana has recognized the need for the vocational and technical education of college dropouts.

Connecticut is training keypunch, IBM, and industrial machine operators in a school for the deaf at Hartford.

Financial aid for students. Georgia has issued a six-page folder giving the financial-aid programs for students in the vocational and technical schools. The folder states that "if paying for your training is the major obstacle you have to hurdle, you might solve your dollar problem right here! There are means and methods available. A rewarding life may be only a decision away."

Florida was able to provide financial aid to 4,160 vocational students in 1966-67. Eighty-nine state and local public agencies employed work-study students.

Utah is using citizens committees to assist in providing scholarships for vocational-technical education. Non-baccalaureate scholarships have been listed for students wishing to pursue post-secondary vocational-technical programs.

4

Organization and Administration

Dr. John W. Gardner has said that "our aspirations have outrun our organizational abilities."[1] Recently, vocational educators have discovered the truth of his statement as they have attempted to develop more comprehensive programs in frameworks little changed since the first organizations were effected, many of them following the passage of the Smith-Hughes Act of 1917 or earlier.

Breakthroughs in organizational patterns have been effected in a number of states. The most notable achievements have been in the organization of public area schools of several types that provide vocational and technical education, but there have also been

---

1 Time, January 20, 1967, p.6.

reorganizations of state divisions of vocational education, departments in universities, and vocational education in the local schools. Plans for reorganization are under way in many quarters.

Organization of area schools for older youth and adults. When the Vocational Education Act of 1963 was passed, each of the 13 southern states was operating or had authorized a state system of area schools. These included vocational schools, technical institutes, and junior colleges. Connecticut, Minnesota, New York, and Wisconsin also had state systems. Partial systems or substantial encouragement to the development to area schools had been provided in California, Illinois, Michigan, and New Jersey. There were some area schools in many other states.

Since 1963 state systems of area schools have been established in a large part of the states that lacked them. They are being considered seriously in almost every other state. Reorganizations of existing systems have occurred in Alabama, Arkansas, Florida, North Carolina, and Virginia. The following examples do not provide a complete picture but they illustrate new designs in area schools.

Alabama has recently completed and put into operation 15 new area vocational schools, making 27 in all. In addition there are 15 new public junior colleges, established since 1963.

Arkansas is operating a state system of 10 vocational-technical schools. A technical institute will open at Camden in 1968. It is located in an industrial park and has seven acres of land, seven buildings, and 175,000 sq. ft. of floor space. The State has also authorized community college districts and two have been formed at Fort Smith and Helena. Each has a technical division.

Colorado has a new State Board for Community Colleges and Occupational Education. There are nine community colleges; two more will open in 1968, one at Colorado Springs and one at Denver.

Connecticut, a pioneer in the development of area vocational schools, has a system of vocational and technical school blanketing the State. Recently an area school to prepare semi-skilled workers has been added.

Delaware has new legislation providing funds for technical institutes.

Florida, which has pioneered in providing junior-college education and now has junior colleges available to nearly all of the population, has added a system of vocational-technical schools. Thirty-four of these have been designated, 12 as departments of junior colleges, and 22 as separate institutions. Ten are operating; 20 will open with new or improved facilities in 1968. $16 million in state support has been provided for area school construction, 1965-67. A further appropriation of $5.7 million for 1967-69 is anticipated. State and local support for the operation of area school programs in vocational-technical education increased from $11.5 million to $18.5 million between 1963 and 1966. The new area school program was preceded by a study conducted by a private consulting firm.

Georgia, which pioneered in the establishment of area vocational schools with the establishment of schools in North and South Georgia in the thirties, has added 21 states vocational-technical schools to its system. A separate system of community colleges is also developing in the State.

Idaho, which has founded five area vocational-technical schools since 1963, has followed a unique pattern in associating them with established colleges: Idaho State University, Boise College, North Idaho Junior College, South Idaho Junior College, and the Lewis-Clark Normal School.

Illinois is developing a statewide system of community colleges. Legislation provides that at least 15 per cent of the courses must be in "occupational, semi-technical, or technical fields leading directly to employment."

Indiana founded the Indiana Vocational-Technical College in 1963. A regional system of technical institutes is being developed.

Eleven of the 16 comprehensive community colleges authorized by the Iowa Legislature are in operation. All provided vocational-technical education.

Kansas has 14 area vocational-technical schools in a new system intended to serve the entire State. The State is also committed to a system of junior colleges.

Kentucky's system of area schools of long standing now includes 14 institutions for older youth and adults.

Lousisiana has added an area vocational school at the State Penitentiary "to provide training most of the prisoners have lacked all of their lives." Its statewide system of vocational schools is being modernized, particularly through the addition of more technical programs.

The Maryland Legislature appropriated $10 million in 1965 for technical institutes and provided $5 million for the construction of community colleges which will also offer vocational and technical programs.

Michigan had post-high school vocational and technical education in 18 community institutes and five four-year colleges in 1965-66. The state appropriation for area-school construction in 1965-66 was $5 million.

Minnesota has 24 area vocational-technical schools, the first of them established in 1945. By 1970, 90 per cent of the population will be within 25 miles of an area school.

Mississippi has 21 public junior colleges with "post-secondary centers" for vocational-technical education. Within a short time everyone wishing to attend a junior college will be able to commute from his home.

An area vocational-technical school has been opened at Helena, Montana, and a similar school is being constructed at Missoula, Montana.

Missouri is establishing 30 area vocational schools to serve high school, post-high school, and adult students.

Nebraska has two state-operated vocational-technical schools and a state-operated School of Technical Agriculture. Locally-operated area vocational schools are being established under 1965 legislation.

Nevada is operating a technical institute at an abandoned Air Force base.

New Hamphsire has one technical institute and five vocational institutes which were authorized in 1961.

New Jersey, which began providing area vocational schools in 1913, has seven technical institutes and 13 community colleges, many of them recently established. New Mexico has four area schools of varying types: a technical vocational institute at Albuquerque, an area vocational school at Roswell, and vocational programs at New Mexico Junior College and the North New Mexico State School. A state vocational school to serve the economically handicapped is being planned.

The Erie County Technical Institute with 16 curricula, 2,500 day students, and 2,500 evening students is illustrative of one type of development in New York.

North Carolina, which opened the first of 20 industrial education centers in 1959, now has 30 institutions in its Community College System and 20 branches of these institutions, all of them providing vocational-technical education.

North Dakota has one long-established technical institute at Wapheton, operated by the State.

Twenty-four area vocational-technical schools have recently been established in specially organized districts in Ohio. Six million dollars was spent for construction and equipment at 14 area vocational schools in 1965-66.

Oklahoma spent almost $7 million for five new area vocational-technical centers during the first three years of funding under the Vocational Education Act of 1963. Five more area schools have been approved by the voters. Oklahoma State Tech at Okmulgee, opened in 1946, had in 1963 a campus of 160 acres, 94 buildings, 21 dormitories with a capacity of 725, and 122 apartments in 21 buildings. Programs were offered in agriculture, business, distribution, trades and industries, and technical education.

Oregon is operating 12 community colleges which provide vocational and technical education. Six more are to be added. The state appropriation for community college construction, 1967-69, is $10 million.

Pennsylvania is rapidly developing both area vocational-technical schools and community colleges.

Post-secondary technical programs were provided in Rhode Island for the first time in 1966. Three million dollars has been appropriated for a junior college vocational campus at Warwick.

South Carolina has a state system of 13 technical institutes and two state-operated trade schools.

South Dakota is developing six area vocational-technical schools under 1965 legislation.

Tennessee has authorized new technical institutes at Chattanooga, Memphis, and Nashville. An enrollment of 1,000 in the fall of 1967 was expected at Chattanooga, about evenly divided between day and evening students. The Institute at Memphis will open in January, 1968 with 750 full-time students expected. Two million dollars is being spent for the Nashville facility to be constructed in 1968. In addition, the State is building 20 vocational schoolsauthorized by the Legislature in 1963.

Ninety-four area vocational schools have been designated in Texas. Sixty-four of these are secondary schools; 27 are junior colleges, 2 are senior colleges, and 1 is a technical institute. It is believed that 96 per cent of all in-school and adult students will have area vocational schools available to them. In one year, fiscal 1966 to fiscal 1967, post-high school vocational enrollments grew from 19,494 to 36,378.

New campuses are being provided for the technical colleges at Salt Lake City and Provo, Utah. A new center for technical education is being provided at Dixie Junior College, St. George, Utah.

Virginia has established a state system of 22 community colleges supplementing its state system of area vocational schools. Vocational and technical education will be an important responsibility of the new institutions. Nine are operating in 1967-68.

Independent vocational school districts were established in Wisconsin in 1911. The State now has 15 technical institutes, 26 vocational schools, and 22 vocational evening schools in these districts. Under new legislation, all areas of the State are to be in independent vocational districts by 1970.

Area schools to provide vocational education for high school students and adults. At least 16 states have recently made some provisions for area schools to serve high school students. In most cases the area schools established serve adults as well.

There have long been area vocational and technical high schools in the largest cities. In some of these cities, and notably New York City, the movement has been away from separate schools and toward comprehensive high schools. The present interest in area schools for high school students is principally in areas with relatively small high schools which are able to provide only limited offerings in vocational education. State policy in Utah is in line with these trends. It supports comprehensive high schools in metropolitan centers and area schools where populations and funds preclude comprehensive schools.

Alabama has ten area vocational schools for high school students in operation; eight are in various stages of development; and several others are pending.

Arkansas has opened two of these schools and possibilities are being studied in three other areas.

Separate vocational high schools are developing in some sections of Florida.

Connecticut has completed its state system of area schools for high school students in vocational agriculture, which replaces about 40 local departments. Each area school serves about six high schools; it is associated with one of these high schools.

Idaho has one area school for high school students in operation, which serves five districts. Another to serve seven districts is planned.

Illinois has established seven of these schools; 40 are planned.

Kentucky has 22 in operation; 10 more are planned for the next two years. The plan is to put all Kentucky citizens within 25 miles of such a school. They are organized as extension centers of area schools for post-high school students and adults. Each of the high school centers has five to eight vocational programs.

Studies are being made in 63 of Michigan's 83 counties which are expected to result in many area vocational programs for high school students.

Mississippi is developing "vocational complexes" for students from two or more high schools. Students will continue to receive their general education in their home high schools.

In Missouri trade and industrial education is being provided through area schools in sections of the State where it did not exist.

The Montana State Board of Education has proposed that "certain schools be designated as vocational training centers."

The South Nevada Vocational-Technical Center at Las Vegas is designed primarily for high school students although it has some post-secondary programs. The first phase, now complete, cost $3.5 million. The second phase will cost $2 million.

New Mexico is operating a pilot program in distributive education with two high schools cooperating.

The Walter Biddle Saul High School of Agriculture and Horticulture has long served the City of Philadelphia. Recently it has been included in the State's vocational program. It has six teachers and a coordinator and serves 350 boys and girls as well as many adults. There is a farm of 78 acres. It is visited annually by about 7,000 elementary and high school students from the schools of Philadelphia and other schools.

South Carolina is organizing "area vocational centers" with students drawn from a number of high schools. Eight are in operation; plans call for 45 more in the next five to six years.

Virginia has constructed buildings for 16 of these area schools since 1963. Nine more are under construction and 33 are in various stages of planning. When the system is complete, there will be provision for students in 74 of the 134 school districts in the State. Two-thirds of the high school students of the State will have five or more vocational programs available in comprehensive high schools or vocational education centers.

Organization of residential schools. There is growing interest in residential schools to provide specialized programs not available in most area schools or to accomodate students from sparsely settled areas. The Association of State Directors of Vocational Education recommended in 1967 that funds for these schools be increased. Some of the existing residential schools are serving students from several states.

Articulating secondary and post-secondary schools. Utah is one of many states in which better relationships between the newly established area schools and the existing high schools are being sought.

A conference on ways area-school personnel workers and high school counselors can work together has been reported in a 71-page publication of the Georgia State Department of Education.

Organizing to encourage greater local responsibility and initiative. The New York State Department of Education has decentralized many if its operations including those in vocational education. Directors of vocational education are being provided in the local schools of many states who can assume some of the responsibility of state supervisors. Utah reports that the local directors are being given more leeway in planning new programs, the inservice education of personnel, and the evaluation of district programs. Discontent with lethargy on the part of some Utah superintendents is likely to result in redesignation of responsibilities to provide leadership that is needed.

California has distributed most of the new funds available under the 1963 Vocational Education Act to schools which have originated projects for their own use.

Reorganization of state divisions of vocational education. Reorganization in the divisions of vocational education in state departments of education reflect recent developments and forecast of the future interests of these divisions. Following are examples of reorganizations in effect or proposed.

The proposed new bureaus within the State Division in California are program-planning and evaluation, curriculum development, reference and dissemination, and audits and approvals.

The new bureaus of the Georgia Division are high school programs, area schools, ancillary services, and fiscal matters, administration, and accounting.

Committees of the staff of the Kentucky Division are working on plans for a new organization which will get away from a service-segregated organization and provide "a more unified approach to administration while still having available the necessary specialists in the various service areas."

The Mississippi Division has added sections for budget and finance, guidance and counseling, work-study, research, and public relations to the sections concerned with six special fields within vocational education.

The major subdivisions of the reorganized New York Division are occupational education supervision, general occupational education, industrial occupational education, and special services.

Adult and vocational education are in the same division of the Texas Education Agency. Subdivisions are administration; secondary, post-secondary, and special adult programs; manpower development and training; veterans approval; and civil defense.

Divisions of vocational education have been reorganized in Illinois, Michigan, and Wisconsin. New divisions of vocational and technical education have been established in Indiana, Minnesota, and Missouri.

Reorganization in the colleges and universities. Comprehensive departments of vocational and technical education have replaced departments for the specialized fields within vocational education at Auburn University, Colorado State University, the University of Illinois, the University of Kentucky, Michigan State University, and Virginia Polytechnic Institute. Plans for an integrated department are under way at the University of Idaho.

Provisions have been made in many institutions for training types of personnel not hitherto prepared. The provision of education for teachers of business has been stimulated by the Vocational Education Act of 1963. Teacher education in trade and industrial education, distributive education, and health education and counselor training have been added to traditional programs in agricultural and home economics education in several schools.

Center for vocational information procurement. Colorado is organizing a center which will collect data about occupational opportunities and disseminate it to high schools and area schools.

5

Revision of Programs and Procedures

Anyone familiar with the vocational and technical offerings in the public schools five years ago must be amazed by the changes which have occurred. Most of the programs now available were offered somewhere in the United States in 1962; the impressive development is the adoption across the country of programs formerly found only here and there. The changes reported in this section are those reported by the states. What is new in one state may be old in another.

The changes of the past five years forecast changes at a geometric rate during the next five years. It would be false, however, to assume that the older programs of proven worth are being abandoned. They remain sound and growing, but this publication is concerned with new designs.

Most of the new programs have two characteristics: (1) they are oriented toward gainful employment in a particular occupation or a cluster of occupations; (2) provisions have been made for evaluating and revising them as they develop.

The area schools are providing a wide array of programs not hitherto available. Typically, there are 10 to 25 programs for full-time students in each area school. Most programs for full-time students require two years; some are one-year programs; and a few continue for 2½ to 3 years. Students may often complete a part of these programs by attending evening or Saturday classes. Shorter programs for adults attending part-time are provided for many occupations.

Area schools usually operate for eleven months each year. Classes are frequently scheduled from 8 a.m. to 10 p.m. with the largest enrollments after 4 p.m.

Program changes will be treated under the following headings.

1. Programs in a comprehensive state system of public area schools (Georgia's)

2. Programs new to the states reporting them

3. Program innovations

4. Curriculum revision

Programs in a comprehensive state system of area schools (Georgia's). The programs available in the public area schools of Georgia illustrate the possibilities of a state system for vocational-technical education. Some of the programs listed are offered only in individual schools but they are available to anyone in the State. Detailed information about these programs is supplied to every school in the State in a special publication.[1]

Air conditioning, refrigeration, and heating
Architectural drafting
Auto body repair
Automobile mechanics
Aviation mechanics

Civil technology
Commercial art
Commercial cooking
Cosmetology
Data processing technology

Electrical appliance servicing
Electrical construction and maintenance
Electrical drafting
Electrical technology
Fabric maintenance management (dry cleaning and laundry)

Instrumentation technology
Machine shop
Mechanical drafting
Mechanical technology
Medical Laboratory assistant

Plastering and tile setting
Plumbing
Power sewing
Practical nursing
Printing

Barbering
Brick, tile, and stone masonry
Building construction technology
Carpentry and cabinetmaking
Chemical technology

Dental assistant
Dental technology
Diesel mechanics
Drafting and design technology
Distributive education

Farm equipment mechanics
Housewiring
Industrial Electricity
Industrial Power Sewing
Industrial Technology

Medical office assistant
Office Machine repair
Optical technology
Painting and decorating
Photography

Radio and television repair
Research laboratory assistant
Residential wiring
Shoe repair
Small gasoline engine repair

---

[1] Area Vocational-Technical Schools of Georgia, Catalog. State Department of Education, Atlanta, Georgia.

Technical illustrations
Textile science
Upholstery
Watch repair
Welding

Programs new to the states reporting them. The variety of new programs now available is shown in the two following compilations listing: (1) jobs or positions for which students are being prepared and (2) programs with vocational objectives which are titled in different terms. Some of these programs are still rare; others have been introduced widely over the country.

1. Occupations for which training programs have recently been provided:

Agricultural foreman
Aircraft mechanic
Appliance repairman
Architectural technician
Assistant dietician

Assistant to a professional home economist in business or industry
Assistant to auto body mechanic
Auto mechanic
Aviation mechanic
Blood Bank assistant

Business-machines mechanic
Business-machines operator
Carpenter
Catering assistant
Certified laboratory assistant
Clerk typist
Companion for the elderly
Court and conference reporter

Chef
Child-care assistant
Child-care supervisor
Chemical technician
Citrus technologist

Data processer
Dental assistant

Dental hygienist
Dental secretary
Electrician
Electronics and space secretary
Emergency Homemaker

Food Processer
Food Service supervisor
Forester's assistant
General office clerk
Geriatric care aides

Guide and worker in rural recreation program
High school homemaker-health aide
High school nursing assistant
Highway technician
Homemaker's assistant

Homemaker health aide
Hospital orderly
Hospital supply aide
Hospital ward clerk
Hotel and motel aide

Hotel housekeeper
Laboratory technologist
Legal secretary
Medical records clerk
Medical assistant

Medical records library assistant
Medical secretary
Middle-level office manager
Nurse (licensed practical)
Nurse (registered)

Punch-card operator
Radio and TV repairman
Residential child-care aide
Secretary
Sewing Specialist
Waitress
X-ray technician

Nurse's aide
Nursery school operator
Nursing home worker
Operating room technician
Psychiatric aide

Stenographer
Substitute mother
Surgical technician
Tool designer
Visiting homemaker

2. Programs with vocational objectives not listed by job titles:

Agricultural business
Agricultural mechanics
Agricultural mechanics for special students
Air frame and power plant
Alterations (clothing)

City planning
Civil technology
Clothing and textiles services
Clothing construction and alteration
Commercial art and layout

Drafting and design
Electronics
Electronics associated with the aircraft industry
Engineering drafting
Farm and ranch management

Food purchasing
Food services
Food technology
Home economics for the mentally handicapped
Graphic arts

Hydraulics
Industrial education for under-achievers
Institutional management
Instrumentation
Interior design

Ornamental horticulture
Park and recreation management
Police technology
Refrigeration and air-conditioning
Retailing

Animal science
Automated record-keeping
Bookkeeping
Child care
Child care for Indian women

Commercial aviation
Cosmetology
Custom sewing
Dimensional quality control
Drafting

Farm business analysis
Fashion merchandising
Fashion trades
Fire technology
Food cost control

Home economics for prospective dropouts
Home management services
Hotel-motel hospitality
Housing
Horticulture for persons with special needs

Job safety (for electricians)
Mechanical technology
Mid-management
Numerical control for metal-working industries
Nursery work

Textiles
Turf management

Program innovations. Kentucky's emphases for the near future resemble those in many other states: "reaching more people, integrating services to meet needs, and more extensive programs for the health occupations and home economics wage-earning occupations."

The North Central states report new program development units involving all services. Business education and health education are being related in Florida. North Carolina had 62 teachers in 1966-67 who offered a course in "Diversified and Comprehensive Vocational Education" for tenth-grade students, and teachers of trade and industrial education and those in distributive education cooperating.

Ten of 13 North Central states provided technical education in agriculture in 47 post high school institutions. The programs offered included agricultural business, agricultural mechanics, conservation, farm and ranch management, forestry, food processing, ornamental horticulture, and park and recreation management.

Thirty per cent of the students in vocational agriculture in Illinois in grades 11 and 12 were in programs oriented toward off-farm occupations.

Pennsylvania is providing education in the use of agricultural resources with special attention to recreation and forest lands.

Idaho has a new course in ninth-grade agriculture for boys and girls, which does not require supervised practice. It is followed by specialization with work experience in the senior year.

Los Angeles has a large and growing program of nonvocational agriculture in its junior high schools. Ornamental horticulture is provided in some large-city high schools including Cleveland, Ohio. Courses in agriculture in city schools for persons with special needs are emerging.

The provision in 1963 of federal funds for vocational office education has led to extensive revision of the high school programs of business education. The emphases in developing the new program stated by Tennessee are similar to those in many other states: "(1) expanded course offerings in improved facilities using modern office equipment, (2) students with adequate background preparation and a career objective, (3) teachers whose qualifications include office experience, teaching experience, and specified certification."

Several states are providing simulated office experience at the schools to supplement cooperative work experience or to provide an alternative to it. The time given to courses in office occupations is increased when experience is provided at the schools.

Post-secondary and adult classes in office occupations are developing rapidly.

Distributive educators are preparing for "middle management". The Virginia program has been pioneer and prototype. At the Richmond Professional Institute students are trained as supervisors and department heads, and as special personnel of other types in retail establishments. Supervised experience sometimes includes service as head of a department. The Florida junior colleges are among those providing "middle management" programs. They are available also in some of the North Central states.

Utah reports an "upsurge in training for the health-related occupations," which is common across the country. The shortage in these occupations are extreme. Many types of workers in these occupations are being trained in addition to practical nurses. A large part of the new health programs prepare technicians.

The "conceptual approach" to the teaching of Home Economics in the high schools has swept across the country in recent years, replacing to a considerable extent the "job" approach. The newer curricula are broader, include concepts drawn from the behavioral and other sciences, and provide an improved background for specialization.

Homemaking for high school boys "has received quite a boost in recent years." In Tennessee the courses in which boys enroll continue for one or two semesters. Occasionally boys and girls are in the same classes. In 1965, a fourth of the high schools in California had courses in Home Economics for seniors dealing with preparation for marriage, family relationships, housing and home furnishings, and family nutrition.

A large part of the new programs in Home Economics are "to fit individuals for gainful employment in any occupation involving knowledge and skills in Home Economics subjects."

Education for public service occupations is emerging. Nevada is providing training to upgrade highway technicians in cooperation with the State Highway Department. It is given at centers throughout the State, often with the use of mobile laboratories. A law enforcement program is under way at the Tampa, Florida, High School with the Tampa Police Department and the County Sheriff's Office advising.

Trade and industrial education has become much more generally available with the development of area schools for high school students, full-time post high school students, and adults. South Carolina, typical of many states with large rural populations, is now providing trade and industrial education in all but three of its counties.

Many of the new area schools for post-secondary students and adults were created solely or primarily to provide trade and industrial education. With the growth of area schools in the Middle West the largest increases in T and I enrollment have been in these schools.

Industrial education has also received a decided impetus from its use to attract new industry. The movement began in the South in an effort to diversify the economy, provide increased employment opportunities, and attract capital. The early growth of area schools providing vocational education in every southern state was to a considerable extent motivated by the desire for new industry. Recently many states outside the South have been using similar measures to hold the industry they have and to attract new industries.

One of the new fields into which trade and industrial and technical education have been extended is preparation for the aircraft industries. Kentucky is building a new area school at Somerset, adjacent to an airport, which will serve students from all parts of the State. It will provide training for many occupations associated with the aircraft industry including aircraft mechanics, air frame, and the electronics associated with aircraft.

Oklahoma, a pioneer in providing technical education, now has it in 25 schools. In 12 schools the associate degree is given. Since 1960-61, 13,266 have been graduated or have terminated their training with marketable skills in technical areas.

Oklahoma has also developed a unique arrangement for training computer programmers and systems analysts. A large computer in the State Department of Education will serve as many as 16 training centers located throughout the State. Eight centers are now using it. Training at minimum expense is provided.

Technical programs in four-year colleges are developing in Indiana, Iowa, Nevada, New Mexico, Oklahoma, West Virginia, and probably in other states.

Contrary to the general trend, apprenticeship programs are expanding in Wisconsin, where the vocational educators have an active part.

Kentucky has made extensive use of federal funds for the manpower and area redevelopment programs, in part because it has had a state system of area vocational-technical schools to implement these programs. During the last five years, 12,871 have been trained in manpower programs and 3,678 in area redevelopment programs.

Oklahoma has enrolled more than 9,000 in more than 40 manpower programs; 70 per cent have been placed. Florida has conducted manpower programs in 61 occupations in 15 counties. Training was received by 2,500 in 1966-67. The program provides basic education, remedial instruction, and counseling as well as training. Each North Central state is reported to be improving and expanding its adult programs under MDTA.

Attention to occupational counseling is being stepped up in many states. More planning and earlier planning of high school and post-secondary programs is being encouraged. There is dawning recognition that high school students should be prepared for the programs available in the community colleges and the other area schools as well as the four-year colleges.

North Carolina in 1963-64 began to offer a course in "Introduction to Vocations" in the ninth grade. The enrollment in 1964 was 2,410; in 1967-68 it is 15,712. The course now requires 171 teachers. New Jersey has launched a similar program in 26 pilot schools.

Louisiana has vocational guidance available to high school students and students in the 13th and 14th grades in its vocational-technical schools. Mr. William E. Johnson, Assistant Superintendent for Vocational Education, believes it to be "a real advantage in effecting a quality vocational program."

Georgia conducted "Tech Days" in 20 of 23 area schools in the Spring of 1967 when prospective employers were able to meet the new crop of graduates. Dates were staggered so that company representatives might follow the program across the State.

Michigan and Missouri have recently conducted regional conferences on vocational counseling for public school administrators and counselors. Nebraska vocational educators have cooperated with the State Employment Service in regional conferences for high school counselors dealing with employment opportunities in agriculture.

Developments at Nova School, Ft. Lauderdale, Florida, will be watched with much interest. Associated with Nova University, it will provide education for persons expected to continue to the doctor's degree. Beginning in the elementary school, students have experiences related to the world of work. At the secondary level, they participate in a basic program emphasizing science and technology. Non-graded, individual experiences relevant to occupational orientation are provided in fields such as data processing, electronics, graphic arts, mechanical technology, and office occupations.

Industrial arts is being extended downward in some school systems. In Georgia it is being provided in grades 5 and 6. Rochester, New York, has introduced the subject below the seventh grade. Home economics and agriculture are being included in many junior high school programs.

California is training homemakers' assistants who are high school seniors. Work experience is provided in selected households.

Tennessee is using Camp Clement, formerly the FFA Camp, to provide leadership training for youth in all vocational services. The Camp has a cafeteria seating 300, modern brick cabins, and a swimming pool.

There is much concern about vocational education for the disadvantaged. Special programs for high school dropouts and prospective dropouts have been reported by Michigan, Minnesota, and Tennessee. Missouri has courses for welfare recipients that are preparatory to employment training. They include reading, spelling, and mathematics. Ohio has shop and laboratory programs for the disadvantaged combining work skills with basic education. The University of Alabama in cooperation with the Vocational Rehabilitation Service has completed a five-year program of "sheltered employment" for handicapped youth, 16 to 18 years of age. The State Vocational School and the Opportunity School at Columbia, South Carolina, cooperate in programs for disadvantaged youth and adults from all parts of the State, many of them delinquents and most of them school dropouts. Texas and Wisconsin have vocational programs for migrant workers.

Westchester County, New York, has a new program in which all of the high schools of the County are participating which is intended to extend a broader and more appropriate type of occupational education to a larger part of the students.

Special programs including counseling and financial assistance are now available in Florida for students with mental, physical, and socio-economic handicaps.

Work-study programs for high school students have been stimulated by the Vocational Education Act of 1963. Programs are reported in every North Central state. Florida has 50 programs in junior high schools designed to provide potential dropouts with training related to work such as grounds maintenance and food service. There are work-study programs in a third of Florida's counties and in the Florida Schools for the Deaf and Blind. South Carolina had work-study programs in 58 high schools in 1966-67.

Louisiana and North Carolina have highly developed and very successful programs to provide basic education for adults. In North Carolina the funds for basic education under the Economic Opportunity Act have been routed through the Community College System, which has enrolled as many as 55,000 at one time in basic education programs. Dade County, Florida, has conducted a mammoth program of basic education followed by vocational education, for displaced Cubans.

"Learning Laboratories" in North Carolina's system of community colleges provide opportunities for individualized learning to qualify for elementary school certificates, high school graduation, and admission to vocational and technical programs. They are used to capacity by older youth and adults of almost all ages.

Texas has been training homemakers in housing developments, most of them unable to speak English.

Washington reports that "part-time programs for employed people have expanded at a tremendous rate in the last few years. There is much evidence to indicate that this type of education will become an integral part of each adult's life work."

Although the principal concern has been for the disadvantaged, Tennessee conducted a vocational-technical program for the gifted at Kirkman High School, Chattanooga, in 1967. Scholarships were available to students with high academic ability and mechanical aptitude. The program carries no credit and is intended for enrichment. Instruction is individualized. One students has commented: "I am now understandong why I have been studying mathematics." The program will continue for three years.

Utah has been giving attention to the entire high school curriculum in small schools in an effort to increase the vocational offerings. Illinois has introduced "interrelated cooperative training" while Minnesota and Wisconsin provide "diversified occupations" courses adapted to the smaller high schools.

Nevada has a vocational program in its State Prison which includes auto mechanics, auto body, laundry and dry cleaning, metal shop, distributive education, home economics for gainful employment, and basic education courses. Florida has been conducting a program in ornamental horticulture in a state prison.

There is much discussion of the role of the high school in vocational education, especially since area schools have developed widely. There has been serious consideration in Hawaii and Washington of the postponement of specialized vocational education until after the high school years.

Most of the new area vocational and technical schools are for commuters and extracurricular activities in them are almost negligible. The junior and community colleges have gone in a different direction. The Junior College at Senatobia, Mississippi, is attempting to combine vocational and cultural interests. Its president emphasizes the development of "human dignity." He believes that vocational education is an important aid.

Curriculum revision. Agencies for providing curriculum guides and teaching aids are developing. Kentucky's Instructional Materials

Laboratory was established cooperatively by the State Department of Education and the University of Kentucky in 1966. It has a full-time director, six specialists in the various services, a commercial artist, and clerical help. It prepares suggested courses, masters for overhead projectors, strip films, and tapes. A curriculum laboratory in the North Carolina Department of Community Colleges has somewhat similar functions.

Florida has issued a county program-planning guide. In use two years, it has assisted county school systems to review their programs annually and project needs for the following year. Information is provided concerning employment opportunities, enrollments and enrollment potentials, course offerings, and funding needs. Project proposals including cost estimates are developed in the counties (school districts), reviewed by area coordinating committees and submitted to the coordinating committee of the State Division of Vocational and Adult Education and the State Superintendent.

Michigan State University is now preparing instructional materials for all occupational areas. Ohio State University has laboratories preparing materials for trade and industrial education, distributive education, and agricultural education. The University of Illinois, which has prepared teaching aids for vocational agriculture since 1938, has a new curriculum guide for high school programs which integrates instruction in homemaking and family life with preprofessional and employment education in Home Economics.

Arizona is structuring instruction in Home Economics to secure articulation among all educational levels. New curriculum guides emphasizing conceptual understandings have been prepared for units in Child Development, Foods and Nutrition, and Clothing and Textiles for use in the elementary and secondary schools. Home Economics students are being oriented to work and career opportunities; cultural and socio-economic differences, are being recognized increasingly. All Arizona junior colleges but one offer programs in Home Economics. Special attention to child development and parent education is provided in the high schools and junior colleges of the State. Three hundred women, at least one-third of them from relief rolls, have completed a program for family health assistants. Half of these are now self-supporting. Special programs in Home Economics for migrant workers, special education students, and economically handicapped adult women are being provided.

A state supervisor of Industrial Arts has been added in Arizona and programs in this field are being modified in the upper grades and the junior high schools. High schools are beginning to provide in-depth general education about the major areas of industry and technology as a foundation for specialization in vocational, technical, and engineering programs. This type of education is considered valuable for girls as well as boys. A publication describing the new program in Industrial Arts, K-12, has been prepared for use by school board members, administrators, and teachers. Close collaboration is developing among those in the Industrial Arts, Trade and Industrial, and Technical programs.

Arizona students in vocational agriculture earned $681,153.35 during the past year in off-farm agricultural occupations. Their income from farm production was $384,593.00, raising their total income above $1 million for the first time. Four community colleges in the State have agricultural programs.

Three Arizona universities are involved in the improvement of vocational counseling. Four counselors are employed in a pilot program in a large metropolitan high school. Six regional manpower employment and counseling clinics for school counselors and administrators, conducted jointly by the colleges and the Arizona Employment Service, have been held.

Several of the North Atlantic states are merging agricultural, Home Economics, and Distributive education courses. Home Economics courses for high school students are being revised to include child care and development, home furnishings and equipment, personal and family finance, and parent and family relationships.

The use of educational television in vocational education is being undertaken in Florida, North Carolina, and other states.

A program of Decatur, Illinois, is representative of a new development in Illinois and other states that is likely to have farreaching effects. At Decatur, 600 adults are enrolled full-time in a program sponsored by the city schools for persons on relief who have been given the choice between getting a job and returning to school. The program includes basic education and vocational education.

Now that Congress has provided funds for the education of Vietnam veterans, it is to be expected that programs paralleling those following World War II and the Korean Conflict will be provided across the country.

6

Provisions for Personnel

It is widely agreed that a shortage of competent personnel is the chief block to the possible development of vocational and technical education.

A recent study of 29 state divisions of vocational education and 179 institutions preparing vocational education personnel, revealed a need for 1,276 persons for positions as supervisors, teacher-educators, subject-matter specialists, and researchers and a maximum of 602 persons likely to be qualified for positions of this type during the 1966-67 academic year. Many of those prepared were expected to be lost to other fields. Many state divisions and universities were not included in the study.[1]

The colleges and universities, which have been the principal sources of teachers for most vocational fields, have been slow to adapt to a drastically changed situation. Personnel from business, industry, and the Armed Forces are being recruited in large numbers, particularly for the area schools.

---

[1] William W. Stevenson. "Vacancies at the Top", American Vocational Journal, 42:5: May, 1967.

New positions are being created, many of them with administrative and leadership responsibilities. Specialists of many kinds are needed. Researchers are in short supply.

With rapidly growing enrollments in the high schools, the area schools, and the adult programs, there is a persisting shortage of teachers who are qualified occupationally but are also qualified to teach and to associate professionally with their colleagues in educational institutions.

The demand is not only for more teachers but for teachers able to adapt to new concepts of vocational and technical education and to teach in fields in which this type of education has not previously been provided.

The most dramatic development is occurring at Jersey City, N. J., where a completely new institution for preparing occupational educators is being developed. The planning of this institution has been under the direction of an outstanding executive borrowed from industry. It will offer bachelor's and master's degrees. A technical institute will be provided on its campus. A staff of 50 to 60 will be required.

Michigan State University is developing a new pattern of vocational teacher education utilizing a clinical-school concept.

The state university colleges at Buffalo and Oswego, New York, and Kearney State College in Nebraska have new programs to prepare technical teachers. New programs to prepare distributive educators have been introduced in Connecticut at Central Connecticut State College and the University of Bridgeport, in two state universities in Florida, at Memphis State University, and in several Kentucky colleges and universities. New Teacher education programs in business and office education have been started in Florida, Indiana, Missouri, and Nebraska. Education of teachers for the health occupations has been initiated in Kentucky. Vocational counselors are now being prepared in Idaho and Kentucky.

A work-study internship at the State University College, Buffalo, New York, enrolled 32 students in the Fall of 1967. Students may spend three to five years in programs leading to the Bachelor's and Master's degrees which combines work on campus with industrial experience.

The Universities of Missouri and Wisconsin are training Home Economics teachers to conduct education for employment. The University of Wisconsin provides a special option in its program for prospective teachers of Home Economics for those who will work in programs preparing for wage-earning.

In four Kentucky state universities associate and bachelor's degree programs are now being provided for trade teachers, some of them now employed as vocational teachers.

Michigan State University has new curricula to prepare specialized teachers of agricultural business, agricultural mechanics, and ornamental horticulture. Ohio State University has established an internship for teachers of agriculture with directed experience in agricultural business and industry. The University of Wisconsin has a post-graduate teacher internship in agricultural education.

Ohio State University and the University of Minnesota have added courses in the organization and development of post high school programs in business and distributive education.

The University of Missouri has provided a graduate program to prepare for administrative positions in technical education in junior colleges. Indiana State University has a program for directors of vocational education.

The University of Minnesota and Purdue University include experience with the disadvantaged in their programs to prepare teachers of Home Economics. The University of Missouri in 1966 launched an interdisciplinary inservice program for teachers of the socially and economically handicapped.

The University of Minnesota provides directed occupational experience for teachers of distribution and marketing. The Trenton, New Jersey, State College is conducting a pilot program for special education students in which industrial educators and special educators share.

New Jersey is conducting three courses for teachers in private vocational-technical schools.

California is training aides for vocational teachers. At Phoenix, Arizona, play schools provide opportunities for prospective teachers to work with young children and to participate in weekly parent discussions.

New responsibilities have led to increasing the staffs of the state divisions of vocational education, in New Jersey in the past three years from 13 to 65, in North Carolina from 20 in 1960 to 52½ in 1967. New staff positions in the North Central states have included those in vocational guidance, programs for persons with special needs, work-study programs, manpower training, business and office education, and research. Florida has added personnel for research, guidance, occupational information, special student programs, and educational materials. Utah has added a deputy state superintendent for post-secondary schools. A supervisor for occupations related to Home Economics has been employed in the South Carolina Division, which has also added a supervisor of its 57 local vocational counselors. The Montana State Board of Education has recommended the addition of a supervisor of Industrial Arts to the State Division staff; a number of states have these supervisors.

The demand for vocational counselors has been increased because of their general use in the area schools and their increased use in the local schools. In Kentucky all area schools are staffed with vocational counselors who work with students, potential students, and high school counselors. North Carolina maintains a ratio of one counselor to each 400 students in its community college system. Counselors in Virginia's area schools assist with placement and follow-up. Utah has a vocational counselor in each of its local school districts.

Kentucky conducted a three-months institute in the summer of 1967 to train 120 occupationally competent tradesmen for teaching positions in the new area-school extension centers for high school students and adults. The training program included internship at an area vocational school.

The inservice education of vocational teachers is receiving increased attention. Summer institutes and other arrangements to prepare teachers of Home Economics to train for wage-earning occupations have been conducted in most of the states of the North Central region, in New Jersey, and probably in most other states. Summer workshops for teachers oriented toward training for employment in off-farm occupations have been common in the North Central states. In the summer of 1967 Kentucky conducted institutes for teachers in psychiatric nursing and the use of youth organizations in instructional programs; for

supervisors and teacher educators on teaching persons with special needs; and for state department and local administrative and teaching personnel on research. Inservice education is receiving more attention generally in the North Atlantic states.

Utah is emphasizing retraining periods in industry for its industrial teachers. One program calls for a month in industry by workshop participants prior to revising curricula in five areas.

A new program at North Carolina State University leads to the Ed.D. degree in occupational and adult education.

Seminars conducted jointly by the American Vocational Association and the U. S. Office of Education in many parts of the country have assisted in training several hundreds for their research responsibilities.

7

New Funds and Facilities

Some states which have spent meagerly for vocational and technical education have increased their appropriations decidedly since 1963. The Montana Legislature in 1967 raised its biennial appropriation by more than 800 per cent, from $90,000 to $1 million. The New Mexico Legislature has appropriated $170,000, a large part to be used for new equipment and instructional aids.

State and local expenditures for vocational education have increased during the recent period of increases in federal funds. From 1944 to 1966 federal funds for Oregon increased by 380 per cent; State funds by 370 per cent, and local funds by 280 per cent. Although federal funds have increased they now provide only $107 of the $831 annual cost per vocational student in the community colleges and $43 of $600 per vocational student in the high schools of the State.

State appropriations for vocational and technical education have increased faster than federal appropriations in several North Central states. The Minnesota Legislature raised its appropriation from $4,350,000 in 1965 to $8,300,000 in 1967. The Kentucky and Missouri Legislatures gave 20 per cent increases at their most recent sessions. The Illinois Legislature appropriated $6 million for area schools in 1965.

The expenditure in Mississippi for buildings and equipment from the passage of the Vocational Education Act of 1963 to June 23, 1967, was $16,931,272. Kentucky has built or is building new facilities for 10 area vocational schools, the individual buildings ranging in cost from $500,000 to $1.5 million. The buildings of four other area vocational schools are to be doubled in size. The total cost of the Kentucky building program since 1963 has been more than $22 million. The investment in buildings and facilities for Georgia's 23 area vocational-technical schools now exceeds $50 million.

In most states, a larger percentage of the funds for vocational education is being channeled to the area schools. In North Carolina the area schools receive 45 per cent of the funds, the local schools 55 per cent.

Although local, state, and federal funds have been increasing, the Association of State Directors of Vocational Education does not believe that they are increasing fast enough to care for impending needs. In 1967 it recommended that federal funds be increased to $400 million in 1968, $600 million in 1969, and $1 billion in 1970.

The recently founded state research coordinating units vary greatly in their fiscal support. Some are in danger of losing it while the Illinois Unit has an annual budget of more than $1 million.

Special facilities of several kinds are developing. Clemson University in South Carolina has a new "media center" to serve schools with vocational programs. New Mexico maintains a library of tape-recorded occupational information including interviews with mechanics, salesmen, and others, which is availble to high school and vocational school counselors. Model stores are being added in some departments of Distributive Education in New Mexico.

8

Research and Development

Research and development in vocational and technical education received its strongest impetus from the Vocational Education Act of 1963, which provided that 10 per cent of the funds appropriated should be used for these purposes. Centers drawing on these funds were established at Ohio State University and North Carolina State University. Large projects were funded in many other universities. More than 400 projects ranging from small to large have been financed under the Act.

Universities and private research agencies not previously concerned about vocational education have entered the field. The Ford Foundation has assisted in establishing a research center at the University of Wisconsin and has funded other projects. The American Research Institute at the University of Pittsburgh, The Massachusetts Institute of Technology, Science Research Associates in Chicago, and the General Learning Corporation have vocational education projects. Universities outside the land-grant college system including Columbia University, the University of Iowa, and Stanford University are conducting studies.

Research Coordinating Units[1] have been established in more than 40 states, using the new federal funds supplemented by state funds.

A center for vocational and technical education has been established at the Ohio State University as a part of the National Information Retrieval and Dissemination System sponsored by the U. S. Office of Education.

Studies preliminary to replanning vocational programs. Many states, areas within states, and local communities have conducted or are conducting studies basic to replanning. Examples follow.

---

[1] Designated at some points in this document as RCU's.

A two-year, statewide study by Arthur D. Little, Inc. began in California in July, 1967. Georgia is developing a master plan for the next five to ten years. A statewide study, ordered by the Governor, has been completed in Missouri. Montana and North Dakota have had recent state surveys. The RCU at the University of Nevada is studying the need for the extension of vocational programs in four school districts. More than 11,000 firms in 32 population centers were interviewed in an occupational survey in New Mexico, completed in 1966.[1] In other New Mexico studies criteria for establishing area vocational-technical schools were developed and plans for a new area school were made. Area studies have been made in 27 of Oregon's 36 counties to determine employment opportunities, human resources available, and needed educational facilities. Studies have focused upon the vocational education problem of small high schools, isolated and single-industry communities, and large cities. Colorado is conducting a study of occupational education and community colleges.

Other state studies include those in Michigan, South Carolina, Tennessee, and Virginia. Local studies have recently been made in Dallas and Richmond. Georgia and North Carolina are among the state which have made special studies of the need for paramedical personnel.

A project to identify problems related to the full participation of Negroes in vocational education programs, secondary and post-secondary, is sponsored by the Georgia RCU with cooperation from Atlanta University and the Center for Occupational Education, North Carolina State University.

Follow-up studies. Many studies for former students and graduates have been conducted or planned.

Colorado lists as research priorities: (1) development and implementation of a systematic program of vocational student follow-up, (2) means of increasing the utility of student follow-up data, and (3) determination and analysis of emerging and projected employment opportunities in counties, areas, and the State.

Georgia has published a 25-page report of a study of the graduates of its area vocational schools in 1965, which has been supplied to every guidance counselor in the State.

New Mexico has studied the careers of all girls in the high school graduating classes of the State in 1961 to learn their implications for education in Home Economics. It has also followed the careers of persons completing and dropping out of manpower programs.

Utah is studying the adequacy of graduates in Distributive Education. Three Utah colleges are cooperating in determining the extent to which high school terminal students and post-high school students enter occupations related to their training.

Research related to the evaluation of vocational and technical education is under way in several North Central states.

Definition of the functions of research coordinating units. Because the research coordinating units are new, each state having one has been obliged to determine its functions. In California these are stated as coordination, dissemination, consultation, and the stimulation of research.

Study of private vocational schools. Under a legislative mandate, Texas completed a study of 1,000 privately owned vocational-technical schools in 1963. New Mexico has made a similar study.

Studies of state and federal activities. The University of California (Berkeley) has reported the findings in a study of state divisions of vocational education in 42 state departments of education. The Oregon State System of Higher Education is initiating more detailed studies to follow the Berkeley study, which will be conducted in eight to ten states.

The Center for Occupational Education, North Carolina State University, is evaluating a program for coodinating the agencies of the Office of Education and the U. S. Departments of Agriculture and Labor in one county in each of three states: Arkansas, Minnesota, New Mexico.

Studies to determine occupational opportunities and requirements. At least 40 states have conducted studies to determine the nature of employment in off-farm occupations requiring some knowledge of agriculture and the training these occupations require. Major attention has been given to occupations in agricultural business, agricultural mechanics, ornamental horticulture, and agricultural technology. The Center for Vocational and Technical Education, Ohio State University, has assisted with and coordinated these studies.

Utah is studying the typing skills required for entry jobs. Tennessee is determining the occupational opportunities at the mid-management level for students in Distributive Education as an aid in establishing programs in community colleges and area vocational-technical schools.

Studies related to programs and procedures. Studies for use in program-planning are under way in Illinois, Michigan, and North Dakota.

Florida is developing new course outlines and instructional materials with special attention to the cluster concept, individualized learning based on interest and ability, and the use of learning-activity packages. Revised curricula in housing and family economics are being prepared for the high schools and junior colleges of the State. A special project in Brevard County, Florida, is providing "ungraded" occupational education for elementary and secondary pupils from the schools of the County in a new building on the campus of the Junior College at Cocoa.

The Georgia RCU is looking at the effectiveness of Home Economics programs for full-time homemakers and homemakers who are also full-time employees.

Kentucky is studying four methods of teaching business and office occupations: simulated, directed (work experience in school offices), battery (a textbook approach), and cooperative (experience in offices outside the schools).

New Mexico is giving attention to prevocational orientation for junior high school students and the scheduling of secondary classes by computer.

Tennessee is studying in depth special areas in the third and fourth year programs in Home Economics. Examples of units receiving attention are: Management for Successful Living, Family Relations and Child Development, Advanced Clothing Problems, Housing and Interior Design, Social

Development, and Preparation for Adult Living. Top-level managers and owners of small businesses in Tennessee are evaluating instructional guides for the high school program in Distributive Education.

Georgia has been concerned with personnel practices in its area vocational-technical schools. Two publications were produced in 1966 by the State Department of Education.[1] Its RCU is evaluating identified admission criteria in terms of students' later performance in area vocational-technical programs with support from the Educational Testing Service and the College Entrance Examination Board, Princeton, N. J.

A statewide survey of the vocational interests of Colorado high school students is being made by the State Department of Education.

The New Mexico RCU is studing the relation of work experience to dropping out of school and social education for employment-oriented youth who are mentally retarded.

Research coordinating units in the North Central States have conducted workshops for local administrators, vocational directors, and teachers to aid in planning, and conducting pilot and demonstration programs.

Broader vocational offerings for small high schools are being studied in Utah. The State's RCU is conducting a nation-wide study of two-, three-, and four-year curricula in commercial art. A vocational program for a state industrial school is being studied by the Utah RCU.

New Mexico is testing a mobile instructional facility used in applied courses in engineering technology.

Georgia is conducting and evaluating pilot programs in cooperative Occupational Home Economics Education in eight schools. It is developing and implementing a self-evaluation plan for vocational-technical schools. Remedial programs in mathematics, science, and communication skills are being developed in five Georgia schools; 15 teachers are involved.

Oregon is conducting pilot programs providing a guidance continuum through the elementary school, the high school, and the community college.

The University of Illinois has an experimental program to prepare industrial education teachers to conduct classes for drop-out-prone youth and a project to develop vocationally-oriented programs for economically and socially handicapped rural youth.

New Jersey used $5.6 million in 1966-67 for pilot projects involving 17,000 students in 150 schools. Fifteen "model office centers" were included; these were judged by outside evaluators. Fifteen pilot projects for seriously retarded pupils were conducted. Cooperative arrangements for conducting innovative projects were set up, each college working with three schools.

1 A Pre-Admissions Information Service Program in Area Vocational-Technical Schools. 76pp.

Developing a Program of Student Personnel Services for Area Vocational-Technical Schools. 261pp.

Innovation in Florida has often involved the coordinated efforts of several vocational areas. Among the innovative programs have been those in off-farm agricultural occupations, gainful employment in Home Economics, vocational business education, technical education, and education for health occupations.

Thirty-two pilot programs in vocational guidance were conducted in 1965-66 in Illinois high schools and area schools.

Tennessee has a pilot program to train occupational therapy assistants, conducted in cooperation with a Veterans Administration Hospital.

RCU projects. The diversity of the research and development projects of the states' research coordinating units is illustrated by reports from Florida and Kentucky.

Sixty projects of the Florida RCU have been completed or are in progress. The following are examples:

A format for program evaluation

A design for determining cost-effectiveness

Summary and dissemination of completed research

Assistance to individuals in developing grant applications

Collection and analysis of data for program-planning

Vocational education of the disadvantaged

Employment opportunities in several occupational areas

The professional competence of vocational teachers

Curriculum innovations

Leadership development

Impact of closed-circuit TV

Guidance and follow-up services

A long list of projects of the Kentucky RCU includes the following:

Employment opportunities involving knowledge and skills in Home Economics.

Farming opportunities in six selected counties in relation to the needs for programs in vocational agriculture

Training needs of semi-skilled workers in Central Kentucky

Research resources in Kentucky accessible to vocational and technical education

Vocational guidance patterns and shortages in Central Kentucky

Public Information and Relationships

Although vocational educators have long been more conscious of their public relationships than most educators, their awareness of the critical role of citizens in determining policies for public vocational education has increased decidedly in recent years.

In many states industrialists have had a leading part in establishing area vocational schools and technical institutes. Persons outside vocational education dominated the Panel of Consultants on Vocational Education which recommended the Vocational Education Act of 1963. Public demands have been strong for attention to the economically and socially deprived and out-of-school, unemployed youth. Advanced technologies have created a shortage of highly skilled labor which the schools have been expected to alleviate.

The American Vocational Association established its Committee on Public Information in 1959 and has assisted in the development of similar committees in many states. An institute for vocational-technical public information officers, held at Atlanta in July, 1967, attracted 20 officials from across the country.

Florida reports that many outside education have participated in discussion and decision-making: business leaders, public officials, civic leaders. These have worked cooperatively with the vocational education personnel in developing the programs of the new area vocational-technical schools.

In Louisiana "as a result of improved and expanded programs, better public relations and acceptance by the public of vocational education have been apparent."

Kentucky has established a public information service in its State Division of Vocational Education which prepares and edits brochures, answers correspondence, and provides information requested by professional personnel. In less than a year since it was established the Service has issued a 112-page bulletin and circulated 25,000 copies each of 22 brochures regarding course offerings in area schools. A 54-page bulletin on vocational education in Kentucky is now being prepared. Newsletters and a book of success stories of vocational education graduates have been published.

Georgia's State Division of Vocational Education has long had an outstanding public information service. The State Division in Mississippi has added a public information coordinator. The Montana State Board of Education in listing objectives for the improvement and extension of vocational education stated as No. 2 "to provide an effective and functional public information program."

Many states have recently prepared new publications for popular distribution. "Vocational-Technical Education in New Mexico" is an example.

Utah and Georgia issue catalogues of vocational and technical courses offered at their area schools and indicate scholarships available. Florida has a publication, "Bridges to Excellence", describing area schools and their contributions to the economic and social development of individuals and communities.

Texas is preparing a guide for preparing publicity for use by teachers.

In a study by the University of California of 42 state divisions of vocational education views regarding vocational education were secured from legislators, school-board members, businessmen, farmers, and industrialists.

Louisiana industrialists have found it desirable to look first at vocational school graduates in meeting their needs for skilled workers.

South Carolina has held a statewide meeting with personnel managers from industry, sponsored by the State Chamber of Commerce and the Textile Manufacturers Association. Speakers from industry, business, and government took part in three regional meetings for guidance counselors in South Carolina in April, 1967.

Utah has disseminated widely among educators and businessmen the report of an evaluation of vocational-technical education by the George Peabody College for Teachers. The report has been used in meetings in many school districts.

Spot announcements for TV and radio stations have been produced at the College of San Mateo under contract with the Bureau of Industrial Education of the California State Department of Education.

Georgia is developing a public information program to recruit teachers for distributive education.

Cooperation with related agencies seems to be increasing. Close working relationships between the schools and the public employment services are required by the Vocational Education Act of 1963. These has long been developing in some states but were almost negligible in other states prior to 1963. In California there are two meetings each year with representatives of colleges of agriculture and the state colleges and junior colleges teaching agriculture. Washington vocational educators are cooperating with personnel in vocational rehabilitation in programs for economically depressed areas.

Activities in cooperation with the employment services are expanding. Some of the contributions of the employment services which are becoming common are supplying information about labor supply and demand, testing to determine occupational aptitude and competency, counseling, placement of graduates, provision of part-time employment after school, weekends, and in the summer, and the use of data secured by the employment services in special studies. The services have also made an important contribution by encouraging youth who come to them to remain in or return to school and in advising adults about training that would fit them for employment.

TOTAL SEASONAL HIRED EMPLOYMENT OF DOMESTIC AND FOREIGN WORKERS IN AGRICULTURE, 1966-1967

1/ Foreign nationals legally imported for temporary farmwork.

Source: In-season farm labor reports for the 15th of each month for domestic workers and for the 15th and end of each month for foreign workers, covering 269 major agricultural areas reporting to Bureau of Employment Security.

POOR WEATHER REDUCED SEASONAL FARM JOBS IN 1967

Extremely bad weather on the west coast and in the cotton belt was a major cause of declining farm employment in 1967. Also contributing to the downtrend was a large reduction in cotton acreage and the usual rise in the productivity of agricultural labor.

Employment of seasonal hired farmworkers in major agricultural areas reporting to the Bureau of Employment Security in 1967 rose seasonally from levels of less than 300,000 during the first quarter to a peak of 1,036,400 in July. For the year as a whole, an estimated 7,098,600 man-months of seasonal labor were used. Seventy-nine percent of this labor was local, 20 percent migratory, and less than 1 percent foreign. While employment of all seasonal workers decreased 4 percent from 1966, that of migratory workers declined only 1 percent. Local-worker employment and foreign-worker employment each declined 5 percent.

Forty-five percent of the total 7.1 million man-months of seasonal labor was used to produce fruits and vegetables. (See Table 1.) For the first time on record, tobacco was the largest single crop in terms of seasonal-worker employment with 673,200 man-months of this labor reported. Cotton, which had ranked first in all previous years, was second with 585,100 man-months.

Cotton employment was 27 percent below the 1966 level primarily because of reduced acreage and production. More acres were diverted in 1967 than in 1966 under the U.S. Department of Agriculture's Upland Cotton Program. In addition, the planting season was very poor--the worst on record in many areas. Plantings totaled about 9,502,000 acres, compared with 10,349,000 in 1966. Heavy losses of planted acreage during and immediately after seeding time, substantial abandonment induced by failure of bolls to open, and freeze damage near the end of the season reduced harvested acres to 8,090,000--the lowest since 1869. Because of unfavorable weather during the harvest season, the yield per acre (452 pounds lint) was the poorest in 6 years. As of December 1, 1967, the U.S. Department of Agriculture estimated the 1967 crop as 7,618,000 bales--down 20 percent from 1966 and the smallest since 1895. Also contributing to lower levels of cotton employment was the increased use of chemical and mechanical weed controls and cotton-harvest machines.

Table 1. Estimated Man-Months[1] of Seasonal Hired Farm Labor, by Crop, United States, 1967 and Change from 1966

Activity	Man-months of seasonal-worker employment 1/	
	1967	Change from 1966
	Thousands of man-months	
All activities	7,098.6	- 312.8
All vegetable ph. & h.	1,681.5	- 54.9
Tomato ph. & h.	313.2	+ 8.9
Potato ph. & h.	211.6	- 6.3

NOTE: Due to rounding, figures may not add to totals.

The use of cotton-harvest machines continued to increase in 1967.

Although total vegetable production was slightly higher than a year earlier, seasonal employment declined 3 percent as mechanization reduced labor needs. A large share of the increase in bean production was in bush beans which can be harvested by machines. Growers in Oregon and Washington have traditionally specialized in pole beans which require a great deal of hand labor. In 1967, growers in both States increased their acreage of bush beans and purchased additional machinery. The combined production of Irish and sweet potatoes was about the same as in 1966, but more mechanical harvesters were used. The effect of California's increased mechanization of the tomato harvest was more than offset by increased tomato production in the North Central and Eastern Seaboard States where mechanization is not yet feasible. Cucumber employment rose as production increased 8 percent.

Total fruit employment edged downward 2 percent as a result of the effect of bad weather on noncitrus production. Total noncitrus-fruit output was 16 percent smaller than in 1966. The greatest declines in tonnage occurred in grapes, followed by peaches, pears, and apples. Growing conditions were unfavorable for western fruit crops, primarily in California. A cold, wet April in that State hindered pollination, slowed growth, and reduced output. This was the primary cause of the decrease in noncitrus production. Also, a late spring frost in the Carolinas and Georgia affected peach production. An increase in strawberry employment was associated with higher production, nationally, and underutilization of workers in Michigan. Citrus employment was substantially over prior-year levels during the first half of 1967 when workers were harvesting the mammoth 1966-67 crop. Part of this gain was cancelled out in the fall when bad weather adversely affected citrus production and employment.

A larger tobacco crop than in 1966 was handled with 4 percent less labor as growers resorted increasingly to labor-saving practices. The usual rapid advancement in the productivity of labor used to produce grain tended to absorb production increases.

EMPLOYMENT DECLINED IN MANY STATES

The majority of States reported lower employment levels in 1967 than in 1966 as labor requirements for most crops continued to decline. Substantial decreases were reported for five States. (See Table 2.) Bad weather, reduced cotton acreage, and rising productivity were the primary causes of employment cutbacks in these States.

Accounting for most of the employment decline in California was the disastrous spring weather which damaged many crops and had repercussions during the remainder of the year. The State's output of most fruit crops decreased. The grape crop was down 21 percent from 1966; the pear crop was only one-

third as large as the preceding year; peach production dropped 19 percent; and one-third less apples were produced. Although California's tomato crop for processing was slightly larger than the year before, 80 percent of it was harvested by machine compared with 67 percent of the 1966 crop.

Drought prevailed over most of Texas during the first half of the year. Dryland farmers needed fewer workers as the drought and chemicals kept the weeds well in hand. Cultivation requirements were further lowered by a 9-percent reduction in cotton acreage. Hurricane Beulah, which struck

Table 2. Estimated Man-Months[1] of Seasonal Hired Farm Labor, United States and Selected States, 1967 and Change from 1966

State	Man-months of seasonal-worker employment 1/	
	1967	Change from 1966
	Thousands of man-months	
United States	7,098.6	- 312.8
States with largest employment decreases:		
California	1,367.3	- 93.3
Texas	1,134.9	- 84.2
North Carolina	960.5	- 40.5
Arkansas	70.3	- 38.7
Mississippi	50.3	- 30.3
States with largest employment increases:		
Kentucky	130.6	+ 35.5
Michigan	252.4	+ 28.2

1/ Based on midmonth employment.

the Lower Rio Grande Valley on September 20, damaged citrus and vegetable crops in the area. Most of the cotton had been harvested in this area, but the heavy rains which came with the hurricane slowed the harvest throughout most of the State. Because of this setback, and because cool weather delayed the maturity of the crop, only three-fourths of the 1967 cotton crop had been harvested by December 1 compared with nine-tenths of the crop a year earlier. The U.S. Department of Agriculture predicted the total Texas crop would be 2,830,000 bales--11 percent smaller than it was in 1966.

North Carolina's tobacco growers were able to produce a larger crop with less labor. The increasingly common practice for growers to present their tobacco for sale in ungraded and untied form has reduced the demand for workers to grade and tie the cured tobacco leaves in bundles. Increased purchases of mechanical tobacco harvesters and stitchers were reported. The growing popularity of tobacco-looping machines has decreased the need for women and youths to hand loop the tobacco in the barns. Vegetable harvesting is subject to increased mechanization in this State. All of the white-potato crop in the Mount Olive area was harvested

One thousand mechanical harvesters were used in California tomato fields in 1967.

mechanically. In the spring, the need for hoe hands was smaller as growers of most crops have developed a better understanding of the use of herbicides. North Carolina's small cotton crop was reduced from 94 thousand bales in 1966 to 45 thousand bales in 1967.

Primarily, the reduction in labor requirements in Arkansas and Mississippi was due to lower cotton acreage and production. In Arkansas, the harvested acreage decreased 17 percent and production 31 percent; Mississippi had 9 percent less acreage and 19 percent less production. The amendments to the Fair Labor Standards Act which went into effect February 1, 1967, reportedly improved worker productivity in these States as growers subject to the minimum-wage provisions of the Act resorted increasingly to mechanical and chemical practices and limited their hiring to highly productive adult males.

Many other States reported small reductions in employment and a few reported increases. In terms of man-months, the largest increases occurred in Kentucky and Michigan.

Kentucky's reported increase in employment was due partly to improved reporting coverage and partly to increased production of several leading crops. Hay production increased from 2.7 million to 2.9 million tons; production of vegetables for processing expanded from 10 thousand to 18 thousand tons; and the soybean crop was enlarged from 7.8 million to 10.9 million bushels.

The increase in the use of strawberry and vegetable workers in Michigan was larger than might be expected on the basis of the increase in strawberry and vegetable production in this State. Strawberry growers spread the work among migrants who had arrived too early in order to hold them for later crops. Pickle employment rose in spite of a slight decline in production. An increase in the value of this crop from $91.40 per ton to $112.00 per ton suggests that selective picking may have been more widespread. Vegetable employment was also boosted by a 60-percent increase in the tomato crop for processing.

MIGRANTS ACTIVE IN FRUITS AND VEGETABLES

Migratory farmworkers were active in every month of 1967 with employment levels of less than 40,000 in the winter rising to a peak of 238,000 in July. Nearly two-thirds of the total 1,409,800 man-months of migratory-worker employment in 1967 was concentrated in the eight States shown in Table 3.

In the first half of the year, a good share of the migrant laborers were in California and other western States working mainly in vineyards, orchards, and strawberry and vegetable fields. During this period,

Florida used a substantial number in citrus fruits and vegetables. In other States, the cultivation of sugar beets and the harvesting of spring fruits and vegetables occupied the attention of most migrants. By early summer, employment of these workers had expanded seasonally in Michigan and other Great Lakes States as cherries, raspberries, and summer vegetables matured. When summer work was done, the migrants usually headed homeward, sometimes stopping to harvest tomatoes or apples along the way.

Although the employment of migratory workers declined only slightly nationally, several States reported a very substantial cutback in their employment. The decline in jobs for noncitrus-fruit pickers was an important factor in California, Washington, and Oregon. Texas reported that fewer out-of-area workers were needed in the northern part of the State during the summer because more local seasonal workers and year-round workers were available.

The use of itinerant workers increased in some States. Heavier production of Florida's citrus fruits, Ohio's cannery tomatoes, and New York's cherries created more jobs for migrants in these States. Although Michi-

Table 3. Estimated Man-Months[1] of Migratory Labor, by State, United States, 1967 and Change from 1966

State	Man-months of migratory-worker employment 1/	
	1967	Change from 1966
	Thousands of man-months	
United States	1,409.8	-19.9
California	312.5	-61.6
Michigan	136.8	+21.7
Florida	129.5	+20.1
Texas	71.0	-17.1
Washington	69.1	- 3.8
New York	62.1	+ 4.0
New Jersey	57.6	- 3.1
Oregon	57.4	- 5.5
Ohio	52.1	+12.5
Other States	461.0	+12.8

1/ Based on midmonth employment.

NOTE: Due to rounding, figures may not add to totals.

gan reported more migratory workers in 1967 than in 1966 during the strawberry- and cherry-harvest seasons, many of these workers were underutilized.

LESS FOREIGN LABOR

Five percent fewer man-months of foreign labor was used on United States farms in 1967 than in 1966. Cutbacks in this type of employment were reported for strawberries, sugarcane, tomatoes, and several other crops.

Employment of foreign contract workers in 1967 was again limited to 11 States--the same States which used foreign workers in 1966. (See Table 4.) Three-fourths of the nationwide total was reported by Florida. British West Indian employment in this State was slightly higher in 1967 because a labor shortage developed in the citrus harvest where very few foreign workers had been employed the year before. During the spring, the groves suffered from prolonged drought and the fruit was rapidly deteriorating. Because of the urgent need to gather the crop quickly, citrus growers were permitted to have foreign workers to avoid crop losses. However, citrus fruits accounted for less than a tenth of the foreign labor used in Florida; 92 percent was devoted to sugarcane.

California's employment of foreign workers was nearly cut in half. Their employment was completely eliminated from the production of strawberries, grapes, and several other crops. Fewer Mexicans were needed in the tomato harvest as machines took over a larger share of the work. The eastern apple States required a few more foreign workers to handle a larger volume of production. Maine potato growers also harvested a larger crop.

ERRATA

The correct piece rate for the strip picking of apples in Massachusetts in 1966 was 25 cents per bushel. This rate was incorrectly reported as 20 cents per bushel on page 13 of the August-September 1967 issue of Farm Labor Developments and on page 14 of the September-October issue of this publication.

LONG-TERM TRENDS IN FOREIGN-WORKER EMPLOYMENT

From the early years of World War II until July 14, 1967, foreign contract workers were employed continuously on United States farms. The period, July 15 to August 13, 1967, was the first period in more than 24 years when all crops in the United States were tended without the help of temporary foreign workers.

For the year 1967 as a whole, 57,700 man-months of foreign labor were used. Of this total, 81 percent was British West Indian, 12 percent Mexican, and 7 percent Canadian. Foreign-worker employment in 1967 was the lowest on record. It was down 90.9 percent from employment in 1964, the last year of Public Law 78 (the Mexican-worker program), and 96.7 percent below the record high in 1959. Employment of Mexican workers also fell to a record low--98.6 percent less than in 1964 and 99.6 percent below 1959. Employment of British West Indians and Canadians was slightly higher than a year earlier but low compared with former years. No Japanese or Filipino contract workers were employed in 1967. 1/

Another measure of the extent of foreign-worker use is the number of workers from other countries admitted for farmwork in the United States. In 1967, 23,603 such workers were admitted. Fifty-eight percent of them were British West Indians, 26 percent Mexicans, and 16 percent Canadians. The total number of admissions and the number of British West Indian and Canadian admissions was slightly higher than in 1966, but the number of Mexicans admitted was the smallest since 1942.

According to weekly reports from regional directors of the Office of Farm Labor Service, Bureau of Employment Security, peak foreign-worker employment was 12,531 on October 7, 1967, compared with 12,864 on September 23, 1966. Corresponding figures for earlier years are not available.

1/ This refers to the program for bringing in Japanese workers, under contract, to relieve shortages of domestic seasonal farmworkers. It should not be confused with the program for training Japanese workers for farm management described elsewhere in this issue.

1/ This does not include Basque sheepherders.
2/ Due to carryover of workers from year to year, the number admitted is usually less than peak employment.
3/ Includes Bahamians.
4/ Data from 1942 through 1947 were obtained from reports prepared by the U.S. Department of Agriculture.
5/ Data from 1948 through 1967 were compiled from administrative reports of the Bureau of Employment Security, U.S. Department of Labor.
6/ Admitted under Public Law 78.

THE OUTLOOK FOR FARM LABOR IN 1968

Robert G. Ainsworth

The need for seasonal hired farmworkers in 1968 is not expected to be substantially different from 1967. Although the productivity of farmworkers will continue to rise and production of some crops will be smaller, these factors may be offset by heavier production of cotton and noncitrus fruits. Since the supply of workers available to farmers is not expected to decline, unemployment among farmworkers will probably remain relatively high.

FARM-LABOR SUPPLY

During the economic expansion of 1961-67, a few seasonal farmworkers left farming to take nonfarm jobs. However, even in boom times, farmworkers are at a disadvantage in obtaining nonfarm employment because of their lower educational attainments and lack of experience in nonagricultural occupations. Improvement in the unemployment rate for agricultural wage and salary workers has lagged behind the downtrend in the overall unemployment rate. In 1968, farmworkers will encounter at least as much difficulty in transferring to nonfarm jobs since the overall unemployment rate is expected to level off at about the 1967 rate--just under 4 percent.

Farmers should not have much trouble recruiting from among their usual sources of supply--young workers, nonwhites, and members of farm families who have given up farming. The teenage labor force is expected to be just as large as it has been in recent years. In 1967, the unemployment rate for workers aged 16-19 was about three times the overall unemployment rate. In 1968, teenagers will probably face stiffer competition for jobs, because the number of workers 20 years of age and over is expected to increase about 1.3 million. The unemployment rate for nonwhites continues to be about twice as high as the overall unemployment rate. 1/ Employment of farm-family workers has been declining by about 200,000 per year during the 1960's. 2/

1/ Bureau of Labor Statistics, USDL.
2/ Statistical Reporting Service, USDA.

Of course many of the unemployed teenagers, nonwhites, and displaced farm-family workers are not willing or able to take farm jobs. However, since no significant increase in requirements is expected, the number available for replacement of seasonal hired workers who have quit farmwork should be adequate.

FARM LABOR DEMAND

The substantial cutbacks in demand for seasonal hired farmworkers which have characterized most years in the early 1960's will probably not continue in 1968. Changes in the U.S. Department of Agriculture's Upland Cotton Program will have a major effect on employment trends. Further, the abnormally poor weather conditions which damaged many crops in 1967 will probably not recur in 1968. There is a good chance that seasonal farm employment may exceed corresponding 1967 levels during the spring and summer of 1968 as crop seasons resume their normal time schedules after the unusual weather delays of 1967.

A sizeable decrease in cotton employment was the major factor in the drop in annual average seasonal farm employment from 762,600 in 1960 to 591,700 in 1967. Between 1960 and 1965, cotton production was sustained at a relatively high level, but rapid gains in the productivity of cotton labor caused employment on this crop to decrease from a yearly average of 212,100 in 1960 to 101,400 in 1965. Between 1965 and 1967, the gain in productivity was moderate, but sharp decreases in acreage and production caused cotton employment to decrease further to 48,800 in 1967. 3/

The drastic decrease in cotton acreage between 1965 and 1967 was due primarily to the 1966 and 1967 Upland Cotton Programs. The enabling legislation, the Food and Agriculture Act of 1965, was designed to liquidate surplus stocks over a 4-year period by reducing cotton production below the expected level of mill and export requirements. Because of poor yields and a strong market, this purpose was accomplished in 2 years. By the end of the 1967-68 crop year, cotton carryover is expected to have been reduced to less than 7 million bales--down sharply from the all-time high of 17 million on August 1, 1966. 4/ Therefore, no further incentives to reduce cotton production are required.

3/ For more details, see Causes and Effects of Declining Cotton Employment, by Robert G. Ainsworth, Farm Labor Developments, September-October 1967.

U.S. Department of Agriculture
Economic Research Service

The principal changes from the 1967 program include a reduction in the required acreage diversion percentage for program cooperators, an increase in the voluntary acreage diversion percentage permitted (along with a reduction in the payment rate), and a liberalization of rules pertaining to measurement of acreage against allotments planted in skip-row patterns. The 1968 program is designed to increase production to a level about in line with expected needs for mill consumption and exports.5/ These needs are estimated to be approximately 14 million bales in 1967-68.6/ A very large increase over the 8-million bale crop of 1967 appears to be in prospect.

The additional production will presumably be handled partially, or entirely, by cotton-harvest machines. Further, the long-term trend toward increased use of chemical and mechanical weed controls can be expected to continue. The offsetting effects of higher production and rising productivity suggest that cotton employment in 1968 will not differ significantly from 1967.

The acreage planted to fresh vegetables in 1968 will probably be about the same as in 1967. With continued increases in consumer buying power, domestic demand for fresh vegetables is expected to be maintained. In addition, the outlook for exports appears good as long as there is adequate production at reasonable prices and reasonable freight rates on the newer modes of transportation.

Acreage and production of canned and frozen vegetables will probably be down only slightly in 1968. However, continued progress of mechanization, particularly of the tomato, potato, snap-bean, and sweet-corn harvests, will tend to further reduce the need for vegetable workers. In California, for example, innovations for the mechanized harvesting of tomatoes will probably reduce manpower requirements. Electronic equipment is being developed there to sort out green, dirty, and spoiled tomatoes. Central sorting will be expanded. In one system, tomatoes are carried in water to central sorting areas to save labor.

Citrus employment, during the first half of 1968, will decline sharply from the corresponding period of 1967 owing to a large decrease in production. The 1967-68 crop is forecast as 194 million boxes--down 28 percent from 1966-67. Weather has damaged the fruit in both Florida and California. 7/

5/ Economic Research Service, USDA, Cotton Situation, October 1967.

6/ Outlook for Cotton in 1968, op. cit.

7/ Statistical Reporting Service, USDA, Crop Production, 1967 Annual Summary, December 19, 1967.

Employment in the production of noncitrus fruits will probably be considerably higher than last year. The abnormally cold, wet weather which caused 1967 production on noncitrus fruits to fall 16 percent below the 1961-66 average will probably not be repeated. 8/ Nearly all of the production increase will be reflected in higher employment levels. The adoption of new technology for harvesting fruits continues to be at a much slower rate than for vegetables. Other than slightly reducing labor needs for harvesting blueberries, cherries, dates, apples, and grapes, mechanization will have very little effect on employment. In the future, mechanical harvesting of the processing portion of fruit crops is a distinct possibility but at present it is primarily on an experimental basis.

California's fruit harvests can be expected to begin much earlier than they did last year when extremely cold spring weather delayed activities.

Tobacco employment may decline somewhat in 1968. Marketing quotas and allotments for flue-cured tobacco--about 60 percent of the total--are essentially the same as for 1967. However, acreage allotments and poundage quotas for individual farms will be adjusted to reflect overmarketings and undermarketings. These adjustments, in all probability, will reduce the 1968 total of individual-farm quotas below 1967. Therefore, production of this important component of the total crop is likely to be smaller in 1968 than in 1967. Marketing quotas and allotments for burley tobacco--about 25-30 percent of the total--have not been announced.

Employment on the cultivation and harvesting of sugar crops will probably be the same or slightly lower in 1968. Through April, Florida workers will be finishing the harvest of the 1967-68 crop estimated at 6.3 million tons compared with the 6.1-million-ton crop harvested in 1966-67. The allocation of acreage that can be cultivated in Florida in 1968 and harvested in 1968-69 is slightly less than the 197,500 under cultivation in 1967. Mechanization of Florida's cane cutting will probably not be accomplished for some years.

Louisiana's sugarcane allotment will be 302,120 acres in 1968, about 5 percent below the 315,000 acres cultivated and harvested in 1967; therefore, employment may decline slightly. Even though Louisiana's harvest is virtually all mechanized, employment may be further reduced by additional improvements in sugarcane planting and cultivation practices and by adoption of more efficient cutting and loading equipment.

There are no restrictions on sugar-beet planting for 1968. The U.S. Department of Agriculture estimates that 1,250,000 acres will probably

---

8/ Statistical Reporting Service, USDA.

be planted--about 4 percent more than in 1967. As far as employment is concerned, an offsetting factor will be further adoption of precision planting of monogerm seed, use of weed sprays, and mechanical cultivators.

UNEMPLOYMENT AND SHORTAGES

No overall shortage of seasonal farm labor is anticipated in 1968, but small temporary shortages can be expected to occur in a few scattered areas. A much greater problem will be to help unemployed farmworkers to find employment. Since competition for jobs is likely to be just as stiff in 1968 as in 1967, the unemployment rate for hired farmworkers will probably exceed the overall unemployment rate by 2 or 3 percentage points as it has in recent years.

Note about the author: Robert G. Ainsworth is a labor economist with the Office of Farm Labor Service, Bureau of Employment Security.

THE JAPANESE AGRICULTURAL TRAINING PROGRAM

B. L. Weiss, West Coast Supervisor
National 4-H Club Foundation

At the beginning of this year, 332 Japanese agricultural trainees were dividing their time between the farm and the classroom in the western United States. The story of how they got here and what they hope to accomplish began with the start of the U.S. Japanese Agricultural Training Program in 1966.

In May of that year the Japanese Agricultural Training Council in Tokyo and the National 4-H Club Foundation in Washington, D. C., agreed to establish and carry forward a two-year work-study program for selected Japanese farm youth.

The JATP which has the official approval of the Governments of Japan and the United States was designed to contribute to the mutual understanding between the two nations and to help the trainees gain knowledge as well as practical experience in modern American farming. The long-range goal for JATP is to build a new generation of farmers with a balanced understanding of agricultural technique and management.

Under the present program a maximum of 400 trainees are programmed in the United States at any one time. Generally speaking, the trainees spend 6 months in the classroom and another 18 months working on host farms. These time segments are divided in ways best suited to labor demand and classroom availability.

The trainees are carefully selected in Japan by the Japanese Agricultural Training Council. They are 18-30 years of age; graduated from a high school; and have a farm background and intend to pursue their careers in agriculture. Prior to the trainees' arrival in the United States, they study English, physical training, farm-machinery operation, introduction

to American culture, and other subjects which would prepare the trainee for his U.S. program. The format of training for each group may vary, but the following is an example of a typical schedule:

> Upon arrival in the United States, the trainees participate in a 1-month intensified English-language course with a brief introduction to American culture, history, and agriculture.
>
> After the initial institutional training, the trainees are assigned in small groups to host farms for a 3-month period where they have an opportunity to receive general work training in agricultural fields.
>
> Following the first work-training program, the trainees receive 2 months of training in an agricultural school where they continue their English language course and also receive a basic introduction to the broad field of agriculture.
>
> Upon completion of the first 6 months of training in the United States, each trainee receives 18 months of work training and institutional training in the trainee's special area of agricultural interest. This institutional training is for a period of 3 months and occurs at the most appropriate time during the 18-month period.

The JATP is a unique cooperative effort on the part of several organizations. In addition to the 4-H Foundation and the Japanese Training Council, the program is sponsored by the U.S. Departments of Labor, State, and Agriculture and the Embassy of Japan. Specific assistance comes from the State Employment Security Agencies and various divisions of the Cooperative Extension Service. The 4-H Foundation staff is responsible for:

1. The final selection of host farmers.
2. The assignment of trainees to the host farms.
3. Orientation for the host farmers.
4. Selection of colleges to conduct the institutional training.
5. Providing guidance to the Extension Service on ways to involve the trainees in the ongoing extension program.
6. Program evaluation, planning, and projection.
7. Assisting the Japanese Agricultural Training Council in solving grievances between host farmers and trainees.

To as great an extent as possible, Japanese trainees are placed on farms commensurate with their interests. These trainees are working at a nursery.

The Japanese Agricultural Training Council provides staff in the United States to coordinate the program with the National 4-H Foundation with the following responsibilities:

1. Reimbursement to the Foundation for the office expenditures for the program and institutional training expenditures.

2. Accounting for the wages earned by the trainees.

3. Solving grievances between trainees and host farmers.

4. Welfare service for the trainees and compensation for non-occupational injuries and disease.

5. Providing counseling and guidance to the trainees.

6. Program evaluation, planning, and projection.

7. Assisting the National 4-H Club Foundation in the institutional and on-the-job training programs.

The financial arrangements are made through the Japanese Agricultural Training Council, but the wages earned by the trainees are sufficient to repay the cost of their transportation to and from the United States, transportation within the United States, institutional training, non-occupational medical expenses, and life insurance.

The Cooperative Extension Service reviews lists of farms prepared by the U.S. Employment Service as prospective hosts for the trainees. The two groups consult and then locate farmers willing to participate in the on-the-job training.

The trainees are assigned to host farmers under a written agreement between the host and the trainee. The agreement stipulates conditions of employment such as:

1. Minimum wage as determined by the U.S. Department of Labor.

2. Insurance for on-the-job injury or disease.

3. Adequate lodging accommodations for the trainee.

4. Transportation from place of recruitment to place of employment and return if agreement is completed.

After the trainees are located on their host farms, the State Employment Service makes occasional visits to encourage them in their work and

generally assess the progress of the program. The County Extension Agent also makes periodic visits to the farms and involves the trainees in the ongoing extension program--particularly 4-H--as much as possible.

Each group of approximately 25 trainees has a group leader to assist in the operation of the training program. The group leader assists with the institutional and on-the-job training programs; helps to solve grievances between host farmers and trainees; helps to maintain high morale among all trainees, etc. The ultimate success of the program is dependent upon providing the trainees with practical skills and knowledge that will, with modification, be applicable to farming in Japan.

The 332 trainees are assigned to the States of Arizona, Colorado, Nebraska, Oregon, and Washington. The following quotes from letters received from host farmers will give some indication of how well the program has been accepted:

> "Their work has been very satisfactory in every way and we have had no problems with these boys of any consequence. They have entered into many community activities, which mainly has come about through various church groups that they are spending Sundays with and the local 4-H leader seems to have done a fine job of getting them involved in a great many 4-H activities. They put a display in the County Fair on agriculture in Japan which created a great deal of enthusiastic comment in the community."

- - -

> "We have felt a certain sense of pride in having our two Japanese boys with us. It has been our pleasure. We have learned much about their country and their respective families. In return they have been very eager to learn our way of poultry farming, and we rarely have to show them how to do anything over the second time. We are using the boys in our community affairs. We have asked them to make a short slide presentation, with descriptions. They do a very good job."

- - -

> "Kiyomi is very interested in his work. He does his work well and without constant supervision. The five boys in our community have attended 4-H functions, Chamber of Commerce meetings, Men's Supper Club, church activities, and participated in family activities."

- - -

> "Our two boys shed tears when they left. Yet at the time they were babies, I was helping to kill their elders. Had there been as much understanding 30 years ago, would it have happened? How about a program between countries we are at odds with now?"

EARNINGS OF FULL-TIME FARMWORKERS

Some workers have low yearly earnings because unemployment, illness, or a combination of factors have prevented them from working steadily all year. Others have low earnings even though they have worked all year at full-time jobs. This paradox of fully employed persons with poverty earnings warrants attention, out of concern both for the individual and for society.

The Bureau of Labor Statistics did a study of the characteristics of low earners in 1965.1/ The criterion of $2,500 money earnings was chosen because this is the minimum amount which would have been earned by year-round full-time workers covered by the Fair Labor Standards Act and its amendments, under the assumption of 50 weeks of work at 40 hours each week and at the minimum wage of $1.25 an hour in effect at that time. Although less than 7 percent of the year-round full-time male workers were employed in agriculture, this industry accounted for over a third of the 3,028,000 fully employed men whose earnings were under $2,500. Agriculture accounted for more male low earners than any other major industry group.

The accompanying table shows that farm laborers fared more poorly than farm operators. Fifty six percent of them earned less than $2,500 compared with 42 percent of the farmers and less than 9 percent of the men in all occupations. At the other extreme, 69 percent of the men in all occupations earned $5,000 or more compared with 25 percent of the farm operators and 11 percent of the farm laborers and foremen.

For farm-nonfarm comparisons, a recent estimate indicates that approximately 30 percent of the nonfarm family's money income is the average equivalent of the farm family's nonmoney income. If this is used as a rough measure to equate the farm and nonfarm earnings of persons, only those farmworkers

---

1/ Perrella, Vera C., Low Earners and Their Incomes, Special Labor Force Report No. 82, Bureau of Labor Statistics, U.S. Department of Labor, May 1967.

earning $1,923 to $2,499--a relatively small proportion of those earning less than $2,500--would be earning the equivalent of $2,500 or more. Further, not all farmworkers receive nonmoney income supplements while some nonfarm workers, particularly hotel and restaurant workers, are provided with board and/or room by their employers. Other nonfarm workers receive certain fringe benefits, such as pensions and health insurance, in addition to their earnings.

Distribution of Male[1] Year-Round Full-Time Workers[2] in All Occupations and Farm Occupations by Annual Earnings in 1965

Annual income	All occupations	Farmers and farm managers 3/	Farm laborers and foremen 3/
Number of year-round full-time male workers (thous.)	34,837	1,717	466
Percent distributive by earnings:			
Total	100.0	100.0	100.0
Less than $2,500, total	8.7	42.3	56.0
$1 to $999	2.8	16.2	17.0
$1,000 to $1,499	1.8	9.7	19.3
$1,500 to $1,999	1.5	8.7	6.4
$2,000 to $2,499	2.7	7.7	13.3
$2,500 or more, total	91.3	57.7	44.0
$2,500 to $4,999	22.3	32.3	32.8
$5,000 to $9,999	52.8	19.0	10.1
$10,000 or more	16.2	6.4	1.1
Median earnings	$6,388	$3,098	$2,274

1/ Only 102,000 females were year-round full-time workers in agriculture in 1965. Because their number was so small, their distribution by earnings level could not be estimated.

2/ Workers who had 50 or more weeks of employment and usually worked full time (at least 35 hours in most weeks).

3/ Occupation of longest job.

REPORT ON RURAL POVERTY

The Report of the President's National Advisory Commission on Rural Poverty 1/ describes the situation as "a national disgrace." This Commission was created by executive order in September 1966 to evaluate the Nation's rural life and recommend ways to improve it. Members of the Commission included businessmen, college professors, union leaders, journalists, farmers, and others familiar with rural conditions. The report was submitted to the President in September 1967 and released in December 1967.

According to the report, some 14 million rural Americans are living in poverty. The Commission's findings showed that hunger, even among children, does exist among the rural poor. Malnutrition is even more widespread. Disease and premature death are "startlingly" high. Most of the rural poor live in "atrocious" houses. One of every 13 houses in rural America is officially classified as unfit to live in. The rural poor have gone, and now go, to poor schools. One result is that more than 3 million rural adults are classified as illiterates.

The Commission estimated the average unemployment rate in rural areas as 18 percent compared with a nationwide average of around 4 percent. It cited a recent study which showed that underemployment among farmworkers runs as high as 37 percent.

"For all practical purposes," the Commission states, "most of the 14 million people in our poverty areas are outside our market economy. So far as they are concerned, the dramatic economic growth of the United States might as well never have happened. It has brought them few rewards. They are on the outside looking in, and they need help."

Until the past few years, the Nation's major social-welfare and labor legislation largely bypassed rural Americans, especially farmers and farmworkers. Farm people were excluded from the Social Security Act until the mid-1950's. Farmers, farmworkers, and workers in agriculturally related occupations are still excluded from other major labor legislation, including unemployment-insurance programs, the Labor-Management Relations Act, certain provisions of the Fair Labor Standards Act, and the Majority of State workmen's compensation acts.

1/ President's National Advisory Commission on Rural Poverty, The People Left Behind, September 1967. This report gives a detailed description of the problems of rural poverty and the rural labor force. See also Farm Labor Developments, October-November 1967, for a further discussion of these problems.

The Commission felt that some of our rural programs, especially farm and vocational-agriculture programs, are "relics from an earlier era." We have not yet adjusted to the fact that, from 1950 to 1965, new machines and new methods increased farm output 45 percent--and reduced farm employment by 45 percent. Nor is there adequate awareness that, during the next 15 years, the need for farm labor will decline by another 45 percent. Changes like these on the farm are paralleled on a broader front throughout rural America affecting many activities other than farming and touching many more rural people than those on farms.

The changes in rural America have rendered obsolete many of the political boundaries to villages and counties. Thus these units operate on too small a scale to be practicable. Their tax base has eroded as their more able-bodied wage earners left for jobs elsewhere. In consequence, the public services in the typical poor rural community are grossly inadequate in number, magnitude, and quality. Local government is no longer able to cope with local needs.

In contrast to the urban poor, the rural poor are not well organized and have few spokesmen for bringing the Nation's attention to their problems. Because we have been oblivious of the rural poor, we have abetted both rural and urban poverty, for the two are closely linked through migration.

The Commission is convinced that the abolition of rural poverty in the United States is completely feasible. The Nation has the economic resources and the technical means for doing this. The Commission has endeavored to chart a course to wipe out rural poverty.

The complexity of the problems of rural poverty preclude the success of a single program or approach. Programs addressed to immediate needs will not erase the underlying conditions creating and perpetuating rural poverty. Programs addressed to these conditions will not immediately help the poor. The Commission's recommendations, which follow, complement and reinforce one another. Together, they will go far to solve the problem of rural poverty.

The Commission recommends--

That the United States adopt and put into effect immediately a national policy designed to give the residents of rural America equality of opportunity with all other citizens. This must include equal access to jobs, medical care, housing, education, welfare, and all other public services, without regard to race, religion, or place of residence.

That the national policy of full employment, inaugurated in 1946, be made effective. The need is even greater in rural areas than in urban areas.

That the food-stamp program be expanded nationwide and that eligibility be based upon per capita income. Food stamps should be given to the poorest of the poor without cost.

A thorough overhauling of our manpower policies and programs, particularly including public employment services, in order to deal effectively with rural unemployment and underemployment. The Commission deplores the fact that the richest, most powerful nation in history compels millions of its citizens to engage in aimless wandering in search of jobs and places to live. The recommendations of the Commission aim at a comprehensive and active manpower program which can be an effective weapon against poverty.

Extensive changes in our rural education system ranging from preschool programs to adult education. Rural schools must be brought up to par with urban schools. The educational system must reclaim youth and adults who drop out before obtaining sufficient education to cope with the complexities of today's world.

Rapid expansion of health manpower--both professional and subprofessional--in rural areas, and the establishment of Community Health Centers which can focus on the health needs of rural people.

Development and expansion of family-planning programs for the rural poor.

That a single unified housing agency be made responsible for housing programs in rural areas and that credit terms be made more responsive to need.

The creation of multicounty districts, cutting across urban-rural boundaries, to cooperatively plan and coordinate programs for economic development.

That increased attention be given to involving the poor in the affairs of the community, on both local and areawide levels.

That the Federal Government reexamine its commercial farm programs in order to make sure that adjustments in the supply of farm products are not made at the expense of the rural poor.

Changes in program development and administration to facilitate and encourage the effective involvement of local, State, and Federal governments.

THE CHANGING STRUCTURE OF AGRICULTURE

Cora S. Cronemeyer

Of far-reaching importance for the future of today's farm operator, his children, and his hired workers is the fading line of demarcation between agricultural and nonagricultural enterprises. Agriculture is tending to lose its identity as it merges with other farm-related industries to form a broader industrial complex engaged in the production and marketing of the Nation's food and fiber. This article traces the steps by which this reorganization has come about and discusses the implications for farm manpower.

THE CHANGING CHARACTERISTICS OF A FARM

A century ago, farming was characterized by a large number of small operating units, each producing to meet the varied needs of a nearby population center. The farm establishment differed from most other types of business in terms of its size, its production practices, and its self-sufficiency. The farmer of that day had very little occasion to do business with other industries. His major factors of production were land and labor. The land he usually owned outright and the labor he generally supplied himself--sometimes with the help of other members of his own family. His production was mostly for home consumption or for sale to consumers who lived nearby.

With the advent of the industrial revolution, the difference between farm-production practices and other production practices diminished, and the interdependence between farms and other businesses increased. Concomitantly, the operation of a farm has tended more and more to resemble the operation of other business establishments.

INCREASING SPECIALIZATION

An early impact of the industrial revolution upon agriculture resulted from the shift of the population from farming areas to the cities. Agriculture's food and fiber production became dependent on other industries to bridge the distance between the farmer and the ultimate consumer. This

development, together with improved means of transportation, enlarged the farmer's market and induced him to specialize. Accompanying specialization there has been a tendency to separate intermediate steps from production of the final product. At one time, the farmer produced his own seed, fertilizer, livestock, and other materials. Now such materials are often purchased from specialists who may or may not be farmers. Thus, not only the selling, but the purchasing phases of the farm operation are becoming dependent on other industries.

EMERGING IMPORTANCE OF CAPITAL EQUIPMENT

While the specialization of agricultural production has been in progress for over a century, farming itself has been largely a handicraft operation until comparatively recent times. Even today, land and labor are more important production factors in agriculture than in other industries. However, as a result of advances in the agricultural sciences and engineering, the importance of land and labor is declining and capital is becoming an increasingly significant factor.

With the introduction of modern farm machinery, the gap between the farm and nonfarm economy in terms of real output per man-hour is closing. In 1947, output per man-hour in the farm sector was 29 percent of that in the

nonfarm sector. By 1966, it had risen to 53 percent. (1) Consequently, the distinctive feature of agriculture as a labor-intensive activity is becoming less prominent.

Increased yields per acre have enabled growers to achieve higher production levels while at the same time they have idled a substantial acreage of cropland from production.

Except for range livestock and cow-calf operations, most livestock activities no longer need to be extensively land based. Broiler and egg production, beef feedlots, pig parlors, and specialized dairy enterprises are cases in point. As these enterprises require the use of larger and larger amounts of capital resources and skilled management, they tend to lose their farming image and become less and less distinguishable from nonfarm activities. (2)

The penetration of the industrial revolution into agriculture itself has revolutionized farm-production practices. One consequence of this is the widening of the variety of the farmer's purchases to include machinery, chemicals, and other equipment needed for the new technology. Farmers today purchase not only products but also services such as technical information, management services, land services (through rental), machine services (through machine leasing), and even custom performance of the farming operations themselves. (2)

Modern production of livestock and livestock products relies heavily on elaborate capital equipment. In this dairy, feed from the overhead cylinder is dispensed by a worker into the feeding unit which is open to enable the cow to eat. The dark hose in the foreground is part of the milking machine. The light hose conveys the milk to the pipes where it flows to bulk storage.

GROWTH IN FARM SIZE

To maximize the unit-cost savings of expensive machinery, use must be spread out over a large number of revenue units. A consequence of the entrance of farming into the machine age has been an increase in the size of the average farm. Particularly during the early 1960's, the growth in farm size has accelerated. (3) One measure of this increase is the rise in cash marketing receipts from $8,179 per farm in 1959 to $13,292 per farm in 1966. This reflects the fact that, between 1959 and 1966, the number of farms which sold $10,000 or more in farm products increased from 828,000 to 1,037,000 while the number which sold less than $10,000 decreased from 3,269,000 to 2,215,000. The following table shows that the larger farm businesses now account for a much greater share of total farm income and expenses than in former years: (4)

	Farms selling $10,000 or more in farm products as percent of total for all farms	
	1959	1966
	(Percent)	(Percent)
Number of farms	20	32
Realized gross farm income	67	83
Realized net farm income	55	78
Farm production expenses	72	85

Among the larger farms, the greatest percentage increase has been in the number of very large farms. The 1964 Census of Agriculture reported that Class I farms (in the sales category of $40,000 and over) accounted for 16 percent of all farms which sold at least $10,000 in farm products in 1964; in 1959 they had accounted for only 13 percent.

It has been predicted that the size of the average farm will not only continue to grow, but that this growth will accelerate. (3) Thus farming, in the future, may come to resemble other industries and the larger establishments will increasingly dominate production.

DECLINING OWNERSHIP OF PRODUCTION ASSETS

Along with the increase in cash receipts per farm, there has been a growth in production assets per farm--from $42,465 on January 1, 1960, to $73,120 on January 1, 1967. The 1967 total included $57,198 in real estate, $7,690

in machinery and motor vehicles, $5,933 in livestock, and $2,299 in other assets. (5) Farmers in the group with net farm incomes over $10,000 typically manage assets in excess of $100,000. Farms with assets valued in excess of a quarter of a million dollars are not uncommon. (2) Full ownership of these assets, once a goal of many farmers, may no longer be necessary or even desirable.

Total farm debt, including real-estate and other debt, increased from $24.9 billion in 1960 to $45.7 billion in 1967. As a proportion of agriculture's total assets, it rose from 12 percent in 1960 to 17 percent in 1967. (5)

Farmers can also acquire the use of productive resources through leasing arrangements. The trend in farm tenure is toward part ownership. One-fourth of our farmers are part owners, but they operate one-half of the land in farms and rent 60 percent of the land under lease. (2) The production services of machinery and other capital equipment can be acquired through machine rental or custom work.

THE ROLE OF THE FARMER TODAY

The central role of the farmer remains unchanged in the changing structure of farming. He is still the entrepreneur who brings the services of land, labor, and capital together to produce our food and fiber. In fact, the farmer is becoming a specialist in this role. The basic change is that more and more of the resources and inputs are owned by nonfarmers or produced by nonfarmers and more and more of the product is consumed by nonfarmers. In general, the farmer's role as business manager (or entrepreneur) is becoming relatively more important than his traditional roles as laborer, investor, and landlord. (2)

THE CHANGING STRUCTURE OF AGRICULTURE

The changing structure of agriculture permeates the entire economy. As agriculture has become dependent on other industries, so have nonfarm businesses become dependent on agriculture. The growing importance of the farmer as a customer is indicated by the increase in farm-production expenses from $26.1 billion in 1959 to $33.3 billion in 1966. His importance as a seller can be measured by the rise in cash receipts from farm marketings. Their value grew from $33.5 billion in 1959 to $43.2 billion in 1966. (4)

Most nonagricultural industries are affected directly or indirectly by developments in agriculture. Most closely involved are those which purchase farm products for processing or marketing, those which transport farm products, those which supply the goods or services needed for farm production, and those which finance the farm investment.

Food-processing plants, as well as farms, provide temporary jobs for migratory workers. While their husbands are working in nearby orchards, these women from Mississippi are employed in a cherry cannery in Wisconsin.

THE FARM-MARKETING SYSTEM

The farm-marketing system serves as an intermediary between the producer and consumer to turn the raw products of the farm into those meeting the form, place, and time requirements of the consumers. It includes those industries which transport, store, process, and distribute farm commodities or items made from them. These industries have a long history dating back to the time when consumers were beginning to leave rural areas to live in cities. In recent years, they have received added impetus from improvements in means of transportation and the reduction in rail freight rates. They have also benefited from consumer preferences for processed foods.

Today, the marketing of farm products is the Nation's largest business. In 1966, for example, the marketing bill for civilian food alone was $55 billion--two-thirds of the $83 billion spent by consumers for domestically produced food. The marketing bill for cotton, tobacco, and other nonfood products represents a significant addition to that for food. (6)

SUPPLIERS OF FARM INPUTS

The purchase of inputs for farm production has not only increased transactions among farmers, but has created flourishing new nonfarm industries. An indication of the industries which sell to farmers can be gained from a breakdown of farm expenditures. In 1966, farmers spent $23.2 billion for operating expenses, $6.0 billion for capital equipment (machinery, motor vehicles, and buildings), $3.3 billion for property taxes and farm-mortgage interest, and $1.5 billion in rent to nonfarm landlords. The operating expenses were distributed as follows: (4)

Item	Expenditures (billions)
Feed purchased	$6.3
Livestock purchased	3.5
Seed purchased	0.6
Fertilizer and lime	1.9
Repairs and operation of capital items	4.2
Hired labor	2.8
Miscellaneous	3.8
Total	$23.2

Some of these purchases, such as livestock and feed, were made from other farmers, but most were made from feed companies, agricultural-chemical companies, farm-equipment dealers, etc.

FINANCE, INSURANCE, AND REAL ESTATE

The increasing tendency for farmers to acquire the use of productive resources through borrowing or leasing arrangements has brought them into closer contact with financial and real estate interests. In 1967, the total $45.7 billion farm indebtedness was about equally divided between mortgage and other debt. Farm mortgage debt, outstanding January 1, 1967, was distributed as follows: (5)

Type of lender	Amount outstanding (billions)
Life insurance companies	$5.2
Federal land banks	4.9
Commercial banks	3.2
Farmers Home Administration	0.6
Other	9.4
Total	$23.3

COOPERATIVES

A growing type of organization is the farmers' cooperative. The net worth of these associations has increased from $4.4 billion in 1960 to $7.0 billion in 1967. Over half of these assets were held by marketing and purchasing associations in 1967. The remainder were in rural electric cooperatives, the Federal land bank system, farmers' mutual irrigation companies, production credit associations, and farmers' mutual fire-insurance companies and telephone companies. (5)

THE NONFARMER'S PARTICIPATION IN FARM OPERATIONS

The involvement of nonagricultural establishments in agriculture goes beyond the buyer-seller relationship to include actual participation in the farm operation itself. One aspect of this participation is the employment of workers to perform agricultural tasks. For example, the operator of a citrus grove may sell his crop to a processor while it is still on the trees. The processor hires the harvest labor. A growing practice among agricultural-chemical companies is to provide not only chemicals but also the labor and equipment to apply them.

Another aspect of nonfarm participation is to provide the farmer with technical management services and/or funds needed for farm investment. Further, the nonfarmer sometimes becomes a partner in the farm operation.

IMPLICATIONS FOR FARM EMPLOYMENT

At one time, the concept of farm employment was clean cut. A farmworker was a person engaged in a farm occupation and employed by a farmer(including the self-employed). As the line of demarcation between agriculture and other industries has faded, so has the distinction between farmworkers and nonfarmworkers. Today, not all farm laborers are employed by farmers,

nor are all of the workers employed in agriculture engaged in the farm occupations. Some are employed as machine operatives, technicians, bookkeepers, and other types of blue-collar and white-collar workers. Further, the wedding of industry and agriculture is giving birth to a host of new occupations.

The implications for the farmworker's future are clear--an agricultural background is a marketable asset in today's economy. Its usefulness is not restricted to the agricultural industry itself but is of value in a wide range of industries related to farming. The food-processing and food-marketing industries are concerned with obtaining a marketable product. In accomplishing this objective, they need to hire men familiar with farm-production practices. The many industries which sell goods and services to farmers need employees who understand the farmer's needs.

Another implication is also clear. Today's farmworker cannot survive the industrial revolution in agriculture unless he broadens his capacities and masters new skills. If he chooses to remain on the farm, he will require training in the new technology and familiarity with the more complex business practices which will characterize the farm of the future. For employment in a farm-related industry, he will need skill, flexibility, and the ability to adapt himself to new work practices.

OPPORTUNITIES FOR YOUTH IN AGRIBUSINESS

Lloyd Dowler, Dean of Agriculture,
Fresno State College, Fresno, California

For young people who have been adequately trained, job opportunities in agriculture and related fields have never been better. Moreover, these opportunities are not limited to young people with a college education. The types of jobs which are available fall roughly into four categories: first, the openings which require workers with bachelor-of-science degrees from agricultural colleges; second, those which are open to youth with associate-in-arts degrees from our junior colleges offering the first two years of training in agriculture; third, jobs for high school graduates; and fourth, opportunities for dropouts from each of these levels of education. In an effort to determine the opportunities for these four groups and to focus attention on new prospects, I will relate this discussion to the full meaning of the term "agribusiness" and urge the reader to keep the definition of this term in mind as we proceed.

Davis and Goldberg have defined agribusiness as "the sum total of all operations involved in the manufacture and distribution of farm supplies; production agriculture on the farm; and the storage, processing, and distribution of farm commodities and items made from them." 1/ Let us take a practical situation and examine it in terms of this definition to be sure we understand how new prospects for youth may come about.

First, let us think of the definition as three links in a chain. The first link represents the kinds of service needed by the present-day farmer in order to grow his crops and raise his livestock. The middle link is the farmer or rancher. The third link in our chain represents the activities that take place after the various commodities have been grown--in other words, the transportation, storage, processing, marketing, and merchandizing of farm products.

To further illustrate our point, let us set up a hypothetical situation where we find the farmer looking ahead to a new crop year. Because our farms have continued to increase in size, one of the first supply items the farmer will need is working capital. If he is a good operator, he has learned that it is good management to use the bank's money and he will talk to the bank's farm loan officer. This man is usually a college graduate with a degree in agribusiness or agricultural economics. At this point, if the farmer thinks the bank's interest rates are too high he may decide to go to the Production Credit Association to negotiate a short-term or intermediate-type loan. Here again, the people he will be dealing with

---

1/ Davis, John H. and Goldberg, Roy A., A Concept of Agribusiness, Harvard University, 1957.

are likely to be college graduates with degrees in some major field of agriculture. Before he receives his money in either instance, a budget will become necessary and a visit to his farm will be made by a bank or Production Credit Association appraiser who is likely to be a college graduate.

With his loan assured, the farmer can then proceed with other steps that must be carefully planned. If he has crops to be planted, he must have seed. The availability of the seed is dependent upon a competent research staff headed up by a plant breeder. Very likely, the plant breeder will be aided by a laboratory technician. In the first instance we are, again, talking about a college graduate, usually a man with at least a master's or doctor's degree in agriculture. The technician could be a junior college graduate with some specialization in agronomy. The sales force responsible for merchandizing the seed to the farmer, or to seed houses, is undoubtedly made up of college graduates with degrees in agronomy.

Before the seed is planted, the seed bed must be prepared. To do this the farmer must have tractors, plows, cultivators, and planters. This introduces the farm implement dealer onto our agribusiness scene. The agricultural engineers who design or assist in the development of the machinery are in great demand, and they are usually college graduates with a B.S., M.S., or Ph.D. degree. Once the machine has been manufactured--and there are thousands of people without degrees working in the factories--there is a need for an office force, a sales staff, parts men, and repairmen to carry out the responsibilities at the dealership level. The sales force is likely to be made up of college graduates with degrees in mechanized agriculture. The parts men and repairmen could be high school or junior college graduates. There is opportunity here for technicians for trouble-shooting assignments in the field and for follow-up after the sales have been made.

After the crop is planted, it may become necessary to apply water. The irrigator charged with this responsibility is frequently someone with less than a high school education. In many regions the installation of the irrigation system may offer quite an extensive list of opportunities. Wells may need to be drilled, pipe lines installed, or overhead-sprinkler systems purchased to spread the water more uniformly. Here again, there is a wide variety of job opportunities for people with various levels of education. The use of sprinkler systems offers many opportunities since there is a tremendous demand for portable, hand-move, and stationary lines for various crops, including turf-grass production.

With the advancement of the growing season, the farmer will encounter both a weed and an insect problem. The chemical companies will be ready to meet his needs with a staff of fieldmen who are highly trained in the agricultural sciences. These men are capable of identifying the kinds of weeds and insects affecting the crop, and have technical information concerning sprays which are effective as control measures and yet safe to use. They will have talked to the farmer earlier in the cropping program about the fertilizers he will need. These men function in somewhat the same

Agriculture provides jobs for aircraft pilots in crop dusting and seeding.

Agricultural scientists are employed in State and Federal laboratories as well as by industries which serve agriculture.

manner as farm advisers and represent one of the largest sales forces on the agriculture scene today. The agriculture graduate working in this field of employment must have a good science foundation with a knowledge of soils, irrigation, plant pathology, plant physiology, entomology, and a thorough understanding of good business principles. The chemical companies offer tremendous opportunities for thousands of high school graduates or young people with junior college or college degrees to the doctoral level. This business is highly competitive. Not only is the company selling a commodity, it is also providing a service. The farmer who is intelligent enough to know how to use this college talent wisely can get real assistance and will have a decided advantage over his neighbor who may question the knowledge of these young scientists.

The materials to be applied for control of the weeds and insects may need to be sprayed on by aircraft. Here we will have opportunities for people who know how to fly either helicopters or planes with stationary wings to apply these materials. Services needed by these highly specialized crop dusters can usually be provided by young people with less than college degrees. Not only are many of our crops treated for insect pests in this fashion, but aircraft are used extensively for crop-seeding purposes.

Soon after the application of weedicides and insecticides, the crop should be ready to harvest. At this point the farmer may decide to avoid further investment in expensive equipment. Therefore, he lines up someone to custom harvest his crop or crops. This procedure, I believe, will become more widely used as more expensive machines are developed to harvest those crops in which mechanization is being forced at a rapid pace because of the high cost of manual labor. Let us be sure to flag this statement because it points up an area for new prospects for both rural and urban youth.

The transportation of the crop, whether it be hay, grain, cotton, or melons, will involve truck drivers, trucks, gasoline or diesel, tires, and a maintenance crew or service crew. Youth with less than a college education will fill the positions at this point in our farming plan. It is very likely that the crop being moved will come under the scrutiny of a county, State, or Federal inspector. These positions are usually under civil service and most job specifications written for such work suggest that a college degree in agricultural inspection and services is desirable. However, many junior college graduates are working in this very important field of employment.

The Food and Drug Administration is having difficulty in obtaining a satisfactory work force to check out tolerances of pesticides being used by farmers. Here again, there are opportunities for new positions such as technicians to operate laboratories in various areas throughout the United States. Once the crop has been cleared for any given market, the job opportunities start to increase in the area of processing and merchandizing.

I believe we have carried this agribusiness concept far enough now to make it apparent that we have many jobs for youth with new prospects that may

not have been thought of before. In California, the Council of California Growers has stated that one out of every three jobs is dependent upon agriculture.

The agriculture schools throughout the United States have graduated over 9,000 young men and women each year for a period of 4 or 5 years and have been unable to meet the demands being made of them by agribusiness firms. These schools have been engaged in an extensive program of recruitment from city high schools in an effort to supply industry's needs more effectively. This may lead us to conclude that there are not enough rural youth eligible for admission to these agricultural schools to meet the needs of agribusiness industries in the future.

By conducting a study of 1,250 graduates from the School of Agriculture at Fresno State College, a bulletin 2/ has been prepared to help high school counselors better understand what is meant by "agribusiness" and to illustrate the kinds of jobs available.

As I visualize the ever-increasing size of farms and the rapid mechanization changes that will continue to take place not only in the harvesting of crops but in the seeding and planting of crops, I cannot help but believe there will be a tremendous need for youth with capabilities of driving, repairing, and servicing these high-cost pieces of equipment. This in turn will mean new prospects for many young people. As this increase in mechanization continues, there will be a real need for vocational schools to be located in key areas throughout the United States. The kind of equipment needed in any training program of this nature will be too expensive to be made part of the regular complement of shop equipment usually found in our high school vocational agriculture departments. Therefore, the area vocational school should be in the best position to meet this need.

A very thorough nationwide study of the employment opportunities and training needs in agriculture and agribusiness is about to get underway. I am indeed pleased that the need to conduct a study of this kind has been recognized. Perhaps more important is the fact that the U.S. Office of Education and its various segments of vocational education will be working cooperatively with the U.S. Departments of Agriculture, Commerce, and Labor and the American Association of School Administrators in collecting these data. The results of this study should help every level of education to plan programs that will provide the future training needed by our rural and urban youth and permit us to continue to lead all other nations of the world in the production of food and fiber.

2/ Dowler, Lloyd, A Counseling Aid to Agribusiness Opportunities, Fresno College Bulletin, Fresno, California, 1963.

Note: This article is based on a speech delivered by Dean Dowler at the National Conference on Rural Youth, Washington, D. C., October 1967.

1/ Employment and Earnings and Monthly Report on the Labor Force, U.S. Department of Labor.
2/ For 1964 and 1965 includes persons 14 years of age and over and for 1966 and 1967 persons 16 years of age and over except for gross average hourly earnings of factory production workers which cover earnings of persons of all ages every year.
3/ Farm Labor, U.S. Department of Agriculture.
4/ In-Season Farm Labor Reports received by the Bureau of Employment Security for major agricultural areas.
5/ An unemployed worker is classified as an agricultural wage and salary worker if his last job was in agricultural wage and salary work.
6/ Could find only part-time work or temporarily on part time due to slack work.
7/ Excluding persons with a job but not at work.
8/ Farm Output Index (1957-59 100), U.S. Department of Agriculture.
9/ Preliminary.

Estimated Peak Seasonal Employment, by Major Crop, United States 1967[1]

Crop	Peak seasonal employment 1967	
	Number of workers 2/	Date
Tobacco	225,400	August
Strawberries	113,600	June
Cotton	91,700	June
Tomatoes	90,200	September
Potatoes	84,700	October
Beans	78,400	August
Bushberries	70,500	July
Apples	69,900	October
Hay	59,700	July
Grapes	56,000	September
Cucumbers	52,600	August
Sugar beets	48,800	June
Citrus fruits	45,500	March
Cherries	44,000	July
Small Grain	32,000	June

1/ Crops listed are those in which 30,000 or more seasonal hired workers were employed at mid-monthly peak.

2/ Employment in all activities including planting, cultivating, and harvesting.

1/ Less than 50 workers.
2/ Employment in Berkeley and Jefferson Counties, West Virginia, included in Virginia employment figures.

NOTE: Due to rounding, figures may not add to totals.

Source: Bureau of Employment Security, In-Season Farm Labor Reports for the 15th of each month.

EXPLANATION AND COVERAGE

Information on seasonal-hired-worker employment is based on monthly reports (ES-223) received by the Bureau of Employment Security from its affiliated State agencies. These reports contain estimates of seasonal hired employment in agriculture by crop activity and origin of worker. The employment estimates relate to the 15th of each month.

The Bureau has delineated 269 agricultural reporting areas throughout the country. Reports are received from each area during its agricultural season, from the first through the last monthly period in which 500 or more seasonal hired farmworkers or any foreign workers legally admitted to the United States for temporary farmwork are employed.

Agricultural workers are defined as those engaged in the production of agricultural crops or livestock and in closely related onfarm activities such as postharvest storage, sorting, and packing which do not materially change the product from its original form. (Workers engaged in such activities as canning, freezing, and cotton ginning are excluded.)

Seasonal hired workers are defined as those who are hired or assigned to work on any one farm or establishment for less than a continuous 150-day period in the course of a year. Because the figures cover only seasonal hired workers employed in major agricultural areas reporting to the Bureau, they are not comparable to hired-worker employment data published by the Bureau of Labor Statistics and the Statistical Reporting Service of the U.S. Department of Agriculture, which include year-round hired workers and have nationwide coverage.

CALIFORNIA

Job-creation demonstration projects resulting in employment of 40,000 to 50,000 poor persons have been financed by the Office of Economic Opportunity. Some program goals were: (1) to determine the effect of having a job available for all who are willing and able to work, (2) to reduce the number of families with income below $4,000 per year, (3) to find the best means of building new jobs in public agencies, (4) to build and test programs that provide opportunities for the new workers to learn, grow, and change, and (5) to increase services to the low-income community by utilization of available manpower. Limitations of existing programs are: (1) Jobs are usually set up outside regular employment systems, (2) The small numbers of individuals employed attract only the highly talented and resourceful poor, and (3) Employment is only at entry level with little opportunity for advancement. Tax cuts are inefficient in raising employment, poverty programs are limited in the number of people they reach, and welfare and unemployment insurance only sustain low level income. Job creation would result in savings in welfare and a reduced crime rate, and the money paid would be spent on consumer goods to expand the local economy in poverty areas. An employment program during training is a necessity for the hard core unemployed. (DM)

ABOUT THE AUTHORS

Harry Specht was born in New York in 1928. He received his PH.D. from the Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University in 1962. His prior degrees were received from City College of New York, (B.A. 1951) and School of Applied Social Science, Western Reserve University, Cleveland, (M.S.S.A., 1953). For the past thirteen years Dr. Specht has been actively engaged in social welfare with particular emphasis on community organization, reasearch, and supervision involving youth and young adults; as well as considerable experience in Settlement House work in New York City.

Before accepting the position of Assistant Executive Director of the Contra Costa Council of Community Services in 1964, Dr. Specht had been Director of the Community Organization Program of Mobilization for Youth in New York City. Prior to that position he had been Director of the Research Project for the National Jewish Welfare Board Study of Young Adults at the Florence Heller Graduate School at Brandeis. His work also included that of Executive Director of the Mt. Vernon Hebrew Camps, Inc. in Mt. Vernon, New York; Program Director for the Mt. Vernon YM-YWHA; and Instructor at Adelphi, Hunter College and Yeshiva School of Social Work.

Dr. Specht joined the faculty of San Francisco State College as an Associate Professor of Social Welfare in September, 1966.

Robert Pruger was born in New York City, January 10, 1933. He received his B.A. (cum laude) degree in 1955 from the City College of New York and his M.S.W. degree in 1957 from the University of Pennsylvania, School of Social Work. He is a Phi Beta Kappa.

Mr. Pruger's work experience has been varied; Senior High Supervisor at Mt. Vernon YM-YWHA. Mt. Vernon, New York from 1957 to 1960; and Program Director at the Vacation Camp for the Blind in New York from 1960 to 1961. He served in the United States Army for a period of one year from 1961 to 1962. He was coordinator of In-Service Training for the Mobilization for Youth in New York from 1962 to 1964. From 1964 to 1966 he was Assistant Chief to the State Department of Public Health, Berkeley, California.

Mr. Pruger is a member of the National Association of Social Workers and the National Conference on Social Welfare.

Mr. Pruger plans to begin full-time study toward his doctorate degree in the fall of 1966 at the University of California, School of Social Welfare in Berkeley.

INTRODUCTION

Job creation programs are one means by which government can support a policy of full employment. To date, however, such programs have been modest and only timidly innovative. This deficiency is a grave one; for, a clear inescapable measure of the success of the poverty war and of the equal rights movement is the degree to which unemployment among the poor is reduced. Though a national program that can achieve this goal is not yet recognizeable, a national debate has arisen that is currently weighing the various strategies through which the country can increase the number of jobs available for the poor. Among the most frequently mentioned strategic alternatives are economic and industrial development, increased investment in training and job upgrading programs, public works, job creation, and extension of the Neighborhood Youth Corps programs.

While we will not be discussing the limitations and virtues of all these different means to deal with unemployment, it should be noted that each achieves different goals. Some, such as economic and industrial development, have only long range effects. The benefits of others, such as tax cuts and education, are often filtered out before they reach the lowest socioeconomic class.

Numerous job creation demonstration projects resulting in the employment of 40,000 to 50,000 poor persons have been financed by the Office of Economic Opportunity. The positions have such titles as "new careerists", "nonprofessionals",

"aides", and "sub-professionals", most of which designate the fact that they are newly created jobs and that the new workers undertake tasks usually reserved for professionals.

By and large these projects have clearly demonstrated that new and interesting jobs which have social utility can be created for low-income people who are poorly educated. With training and supervision the incumbents of these positions have performed in their jobs with greater responsibility, interest, and ability to learn than anyone would have expected.

However, the vast majority of these programs have three characteristics which limit the value of the new jobs:

a) Most of the jobs are set up <u>outside</u> of the regular employment systems of established agencies. In government, the jobs are usually of a temporary appointive nature. They are not civil service positions and consequently do not give the new workers the security and the benefits of civil service;

b) The programs usually deal with relatively small numbers of people and as a result it well may be that the programs have exercised a selection process that brought in a high proportion of highly motivated and talented poor. Different administrative and programmatic planning will be required to operate such programs on a massive scale;

c) The overwhelming majority of the new jobs have been entry level positions. While positions of minimal responsibility and pay may be appropriate for a majority of the unemployed poor, it is not true for all. It continues to surprise many that

some low-income people are educated or otherwise qualified and quite well able to assume more than an entry level responsibility. Jobs should be available for them, too. A dead-end position offers little incentive to those new workers who otherwise would and could learn and grow through employment.

PROBLEM

1. Need to Have More Jobs Available for the Poor

Automation is rapidly reducing the job opportunities in the material production, soil tilling, and non-professional service areas. At the same time our population is exploding. By 1975 we can expect to have 225,870,000 people in this country; 107,682,000 will be twenty-five years of age and younger. (17)

We are now entering our 56th month of economic expansion, the longest peacetime expansion in our history. Since the beginning of this period, the gross national product has grown well above our long term rate. From an average utilization of 80% of factory capacity, we are now utilizing over 90 percent. From 1961 to 1965 this expanding economy has created over 5,383,000 jobs. From July, 1964 to July, 1965 alone, we added 2,449,000 jobs. But even with this unbelievable record of growth we were still left with a 4.4 percent unemployment rate nationally in September, 1965 and according to the Council of Economic Advisors, there is little hope of lowering the rate below 4 percent in the near future.* Added to this must be the fact

---

* The drop of the unemployment rate in February, 1966 to below 3.7 percent is in response to the build up for the Viet Nam war. The problems of unemployment in ghetto areas persist, even with the war industries. However, the

that by 1975 there will be 1½ million fewer jobs in agriculture than there were in 1960. (11) Thus, the migration of unskilled rural people seeking jobs in the city will intensify the problem of unemployment among low-skilled workers.

More importantly, unemployment falls unevenly. Among certain groups such as youths and minorities, and in certain communities, the unemployment rate is two to four times the national rate. In August 1965, for example, the national unemployment rates for non-whites was 7.9 percent, more than double the 3.7 percent rate for whites, and rates for youths and minorities are markedly higher than national rates. A disproportionate share of this unemployment occurs in the ghetto areas of our larger cities.

Thus, although measures to stimulate the economy have worked as well as anyone dared expect, it seems that our economy can operate at near-full capacity without utilizing large numbers of unskilled persons. To bring them into productive use in the near future, we must search for a more direct approach. Heilbroner, in a recent paper discussing the future of capitalism put it this way:

> "If the continued incursion of technology coupled with a very large inflow of young people into the labor market, should create an employment crisis....policies designed deliberately to create employment through a substantial enlargement of public activities....might well show up as part of the practicable public agenda. (4, p.28)

---

manpower utilization model we are developing here is based on the problems of our peacetime economy and should be pursued despite momentary changes due to war industries.

2. The Particular Problems of California

California suffers from unemployment more than the average state. (12) As evidence of California's special problems, during the past record peacetime economic boom when the national unemployment rate dropped from over 6 percent to 4.4 percent, California's rate remained about 6 percent. In the twelve most poverty-stricken areas of the state the rate has remained about 10 percent. In the past five years, we have created 180,000 jobs a year, but we have 192,400 new people each year looking for work. As of September, 1965 there were 351,000 identified unemployed. Of the unemployed who were insured, 44 percent were unskilled or semi-skilled workers.* The gap between the rich and poor in California is dramatic and apparently as difficult to bridge as in any other state.

The tremendous migration to California adds to the problem of unskilled labor. We receive 350,000 migrants a year. Most of the migrants possess enough skills to qualify for the existing job market. But a substantial number are unskilled workers from the poorer parts of our country where educational and social services are limited. These people move into reception center areas like Watts because of restricted housing practices. Any tightening of the job market finds them to be the first people fired because the existing job market requires increasingly smaller numbers of unskilled labor-

---

* Only about one-half of the unemployed of California are insured. The percentage of uninsured unemployed is, of course, much higher among unskilled workers.

ers. Unemployment rates in some census tracts in these areas reach as high as 30 percent.*

No state, on its own, possesses the resources to finance a significant amount of work for the unskilled unemployed. California has already strained her resources to the breaking point in providing schools and services to a rapidly growing population and addressing other social problems of the poor.

Moreover, this failure of an expanding national economy to substantially reduce large pockets of unemployment in California is due to such nationwide causes as the revolution in automation and technology, the vagaries of defense spending, and the huge migration of the unskilled and uneducated to California. A very high proportion of the unemployed in our state were born elsewhere. For example, in one area of Los Angeles about 80 percent of the unemployed Negro and Mexican-American men were born outside the state. (20, p.62) Over 39 percent of the residents in East Los Angeles and over 26 percent of the residents of South Central Los Angeles who are 25 years old or over have not completed the eighth grade. California is paying the price of the paucity of educational facilities in other areas.

Since we have inherited national problems we must seek national remedies.

---

* For example, the estimated unemployment of males 14 and over made by the CAP for West Oakland is 33%. Reported male unemployment for the West Richmond area is 18.9% and for census tract 65 within that area it is 28%. In a recent survey of the Watts Willowbrook

3. Deficiencies of Existing Measures

Existing measures to combat poverty fall into two broad classifications. The first consists of monetary and fiscal measures, such as income and excise tax cuts. These measures deliberately increase consumer demand power as a means to indirectly force the employment of additional plant and labor capacity to meet that enlarged demand.

But if the objective is to reduce unemployment, why use this inefficient, roundabout method? Why not concentrate on directly hiring the unemployed? This method would result in a triple benefit. First, in a job creation program 80% of the initial expenditure is made as wages for the unemployed (in contrast, none of the initial funds released by tax cuts serves this purpose). Second, the private sector would experience a greater demand for goods and services, since the unemployed spend a higher percentage of their new earnings and spend it sooner than any other group. Third, creative jobs for the poor return socially useful labor to society, while a tax cut is given for nothing.

The second set of governmental measures to combat poverty includes all of the traditional and recent poverty programs. These programs provide either limited amounts of income, social services, or work experience to upgrade the work skills of individuals.

There is no question that these programs contribute to a better economy and society; however, they simply are not designed to create jobs in numbers equal to the numbers of hard core unem-

---

area of Los Angeles, it is reported that 21.9% of the total labor force were unemployed (compared to 4.6% for L.A. County). (Economic Youth Opportunity Agency 1964 Demographic Survey of South Central Area.)

ployed. Training programs, for example, affect only a small percentage of this group. The almost exclusive preoccupation of training programs with the supply side of the labor market (i.e., preparing individuals for presumably already existing and currently vacant positions) permanently limits the support they can give a public full employment policy. Such a policy also requires programs that immensely increase the total demand for labor, particularly by creating useful jobs that tap the existing talents of those generally perceived as being 'unskilled'.* Training for this group, a good deal of evidence suggests, is most successful when it comes as an opportunity derived from employment, rather than as a prerequisite for it.

Present income maintenance schemes, such as unemployment insurance and public welfare, mere-

---

* Though the term "unskilled" is used in various parts of this paper to refer to the able-bodied, hard core unemployed, it is done so only as a matter of colloquial convenience. It is recognized, however, that the term is by no means an objective one. Indeed, the term could be used with at least equal accuracy to describe a society"unskilled" in developing occupational roles that exploit the capabilities of the various persons and groups that make it up. In virtually all pilot programs the speed and simplicity with which "unskilled" and unemployed domestics, housewives, high school dropouts, janitors and laborers have become valued school-community workers, probation assistants, police-community aides, and the like, amply demonstrate the point. In each of these cases it has not so much been that the "unskilled" became "skilled", as it has been that a positive social role was built around their previously unrecognized, but always present, talents.

ly sustain income at fairly low levels, and they do not provide access to the higher incomes and feelings of self-sufficiency associated with work. In addition, coverage is limited. Most recently, two critics have even defined these defects as non-correctable within the limits of current programs. (1)

Because a decreasing percentage of the expenditures for heavy construction goes to meet labor costs, public works projects are a much less efficient means to create jobs for the unskilled than they were 30 years ago. On the Oroville Dam project, for example, only one job was created for every $26,000 of expenditure. Of the average 646 persons working on this project in 1965, 172 were classified as unskilled. Thus, at Oroville, it cost approximately $100,000 to create one unskilled job; the job creation proposal described below costs only $5,000 per unskilled job.

4. Shortage of Professionals and the Need for Change in Service-Giving Agencies

Despite the gloomy forebodings we see in all of the trends for employment, much of society's important work is not being done, particularly in the human services field. The readily available and well known statistics that detail the chronic and worsening shortages of doctors, social workers, teachers, nurses, lawyers, etc., need not be repeated here to establish the point. These fields, using their full training capacity, are annually increasing their professional numbers by the hundreds at the same time that our annual national population is growing by the millions. And even under optimum conditions, the situation is not likely to change for the better. Assuming a perfectly coordinated development, for example, it takes nine years before construction of a medical school results in the first new doctor emerging from that school.

Clearly, our people cannot be served merely by extending the existing model by which impossible, unavailable amounts of money, time and talent are required to maintain an unnecessarily sharp distinction between the helpers and the helped. Not only does the invidiousness of the client role suggest that the above arrangement is inherently immoral, but the arithmetic growth of helpers contrasted to the geometric growth of those needing help makes that arrangement currently impractical and, in the not too distant future, must render it completely untenable. A solution to this dilemma, of course, and the one being proposed here, is to consciously blur the distinction between the helper and helped by finding effective work for the growing number of our population who cannot participate as material production workers in what we have traditionally defined as exclusively professional activities. (4)

The United States already has more of its population in institutions than any other country of the world. It has a much larger unemployed welfare recipient group than many European countries with relatively similar social systems. Estimates of the numbers of incarcerated persons in different countries with similar cultural patterns and penal codes for the year 1960 dramatically illustrate the point:

United States	- about	200	per	100,000
Denmark	- "	73	"	"
England and Wales	- "	59	"	"
Norway	- "	44	"	"

(20, p.82)

We are already seeing breaks in the legal and political barriers which define people as recipients rather than participants. The Civil Rights movements and many of the recent court decisions are only early expressions of a demand to shift the social structure that establishes "ins" and

"outs". Brought to the terms of this paper, in our increasingly automated economy we are going to have to find ways of screening people into employment in the service professions, rather than screening them out.

Our welfare agencies and our institutions for the mentally ill, the retarded, the delinquent, etc. may have returned some to full participation in society, but they have contributed to the permanent physical, social or psychological segregation of many more. It may be argued that the screening out of the more upsetting classes of deviants at least once served the convenience and maintained the morale of the far more numerous main population group. However, in a nation and a world characterized by a renascent, raucous, unrelenting demand for participation, that argument becomes as empty as the arrangement it supported is anachronistic.

For the social services this means shifting attention from the study and treatment of illness and deviance to a concern for ways to foster human development. And in this turn to the human services, reorganized and more rationally staffed, the vast potential for the employment of the poor can be overlooked only, as was "The Purloined Letter", because it is so obvious.

JOB CREATION

1. Government Can Profitably Use Unskilled Labor

Pilot projects in our state and in other parts of the country demonstrate that unskilled persons can appreciably raise the quality of service offered by government. (7,8,9,11,12,14,15,16)

In the land management and conservation field, this proposition is readily demonstrable. Unskilled labor offers the opportunity to clear and maintain more areas of public lands, work which would not otherwise be funded. Our state and county resources agencies and an informal President's Committee on Emergency Work Programs, organized by Dr. George Mehren, Assistant Secretary of Agriculture, which included Charles Connaughton and William Dresser of the United States Forestry Service, have developed over 30,000 unskilled job possibilities in California in land management and conservation alone. (17) Most of these jobs could be ready to go within 60-90 days after approval.

In other fields, estimates show that state, local, and nonprofit agencies in California could productively use scores of thousands of aides in the fields of mental hygiene, education, probation, recreation, public health and social welfare. This labor would enable existing agencies to markedly improve their service. (2, 9, 10) For example, it is projected that from 1960 to 1975 there will be a 65% increase in the numbers of people employed in the professional, technical and helping services. Educational services will swell to absorb an elementary school population that will increase by 15%, secondary school enrollments will increase by 50%, and the college-age population will increase by 70%. (11, p.10)

The opportunity to use hundreds of thousands of unskilled men and women in permanent jobs exists in state and local social services. Subprofessionals can, first, relieve professionals and semiprofessionals of routine duties, thereby freeing their time for higher quality services; second, they can facilitate and influence the communication that occurs between professionals and their clientele.

Actually, as suggested earlier, the scarcity of professionals caused by the State's provision of human services to a growing population forces a more rational use of existing professional time. Professionals do not return the social investment made in them when they engage in tasks unrelated to their costly, specialized training. The subprofessional is able to perform many of these tasks immediately and on-the-job training can qualify him for the next skill level in the particular field. This way of structuring the entry of subprofessionals, thus, opens up new careers for the poor.

In the past, jobs for subprofessionals have developed largely through budget necessity. (4) Social agencies desiring to explore new patterns of service delivery are handicapped by an inadequate supply of both professionals and funds. Corrections, for example, has turned to its lay correctional officers and to its inmates for developments in education, institutional maintenance, in group counseling, in therapeutic community programs, and even in research. It has given considerable support to the self-help movements--probably not so much out of any sophisticated belief in the ability of problemed people to help cope with their problems, as out of the necessity for developing programs with minimal funds. The Alcoholics Anonymous programs in institutions, as one instance, have been ways to fill time without having to fight for new budgets.

It is possible that such efforts have helped pave the way for a necessary expansion of activities within the professional fields, particularly as they have suggested the range of service tasks which do not require a professional's formal training. Indeed, there is evidence to document the claim that the subprofessional can perform tasks for which the professional is not as well equipped. For example, in the field of corrections it has long been known that the main influences on institutionalized offenders are other offenders. Cressey has stated, "The way to build an effective correction system is not to try to take away the power of the inmates, but rather to figure out ways to use inmate power for correctional purposes." (3, p.116)

Evidence from unsystematic uses of subprofessionals and from the self-help movement is now being supplemented by demonstration projects funded through the Office of Economic Opportunity and the National Institute of Mental Health. Results of these experimental assignments of professional tasks to the poor (i.e., employing them as assistant teachers, mental health aides, homemakers, child care aides, police-community relations aides, community organizers, etc.) suggest that when it is directed toward the poor, service is improved by utilization of the poor in at least two ways.

First, the likelihood of a favorable response of the client to the service offered increases. This is because the poor in service are able to relate more easily to a client in similar circumstances than a professional can. They are privileged communicants to information not shared with the more remote middle-class practitioner. They can provide valuable feedback on the attitudes and needs of the poor to which the professional does not have access. Their style and value systems are less likely to antagonize the client. They provide visible evidence that there is opportunity for the poor to improve their state.

Second, the utilization of large numbers of poor in the helping services is rehabilitative in its own right. The persons giving service experience the sense of belonging, the sense of competence, and the sense of making a meaningful contribution which are restorative of personal worth and dignity. And, in addition, they are participating in a flow out of poverty which is the most effective weapon against the most corrosive ailment of modern urban life, the ghetto existence.

2. The Unproductive Poor

The poor contribute little to the economy. They add little to tax collections and draw heavily from tax revenues in the form of public welfare and other institutional costs. Large numbers of immigrants to California are among the present and future poor. For example, 18% of the population in East Los Angeles and 21% in South Central Los Angeles moved into these areas in the 5 years prior to the census. (20, p.65)

The potential impetus to the economic development of a community which will accrue from a massive employment program has not been investigated systematically. The overwhelming proportion of monies invested in this way will be used by new workers to purchase consumer goods in their own neighborhoods, thus encouraging the development of local small businesses (with the added benefit of more jobs for local people).

3. Although Expensive, Federal Revenues Will Be Available to Support Job Creation Programs

The Council of Economic Advisors estimates that federal government revenue at current taxation rates will increase about $6 billion each

year. By 1970, the federal revenues will be $35 billion higher than in 1965.*

The federal government must make some disposition of that revenue merely to maintain the balance between how much is taken out of the economy and how much is returned. Reducing the national debt will not be economically feasible because of the deflationary effect of placing money in the hands of those with a low propensity to spend. Thus, the government must either increase expenditures, return the funds to the states, or cut taxes.

To cut taxes and give the employed more income at a time when a significant number of persons are not receiving any income would be unfair. If the money must be spent, it should be expended on alleviating critical unemployment while also securing the beneficial effects of this labor for society.

Of course, the ultimate cost to the community of such a program will be less than the initial expenditure. Some reduction in welfare and unemployment insurance costs will occur. These reductions, however, will not be as large as one might expect since only a small proportion of transfer payments which maintain income go to the poor. (6) For example, in California about one-half of the unemployed receive unemployment insurance. However, the percentage of uninsured unemployed is much higher among the unskilled in the pockets of poverty.

But there will be some reductions in welfare costs. For example, about 13,000 able-bodied males in California receive an average family payment of $210 a month under the AFDC-U pro-

---

* This increase occurs simply as a consequence of the growth of the level of industrial output. (5, p.26)

gram. Providing jobs for these recipients would save approximately 50% of what the community now pays, thus offsetting about half the cost of providing the job. (Unemployed adult males would constitute a primary target group for this kind of program.)

Finally, there would be savings from the reduction in crime and other individual and social destruction. Although most experts refuse to reduce the relationship of crime and unemployment to a simple one with predictive value, they do concede a positive correlation whereby giving a man a regular job certainly makes him less crime prone.

For California, keeping individuals from a life of crime is indeed an expense to consider. We know, for example, that the crime career of each adult felon arrested costs the public agencies an average of $4,000 a year, including an average cost to the state of $2,200 a year for each adult sent to prison. Juveniles are even more expensive, representing an annual incarceration cost of about $4,000. California's annual cost for all adult and juvenile felons is $478 million. (13) Even a slight decrease in these rates would make the proposed program financially worthwhile for taxpayers, while the resulting social values are incalculable.

4. Significant Resources for Employment Are Already Available

The Medicare Bill of 1966 by itself expands human services by more than one-half billion dollars annually in California alone. Extended comprehensive services will be offered in maternal and child health, crippled children's care, in-patient hospital care, health services for school-age and pre-school children, child welfare, day care, mental retardation, as well as

health care for persons 65 or older. This program alone presents enormous opportunities for the creation of new jobs for the poor.

Similar opportunities exist with the Federal bill setting up heart, stroke and cancer centers, as does the 80 million dollars allotted to California under the Compensatory Education Bill. State and Federal expansion of vocational rehabilitation, mental retardation, and alcohol treatment programs offer other possibilities for job development.

Projects carried out for the California State Office of Economic Opportunity by the New Careers Development Project have documented the productive use of the unskilled in the following areas:

a) Mental Hospitals -- at Stockton 40 psychiatric technicians, trainee aides, have had remarkable success in improving care at the hospital.

b) Schools -- teacher's aides allow the teacher more time to concentrate on teaching; large scale use was successful in Pittsburgh and Philadelphia. Also, many school districts in our own state have used aides; school counseling aides work with professional counselors in reaching families of children in difficulty; playground aides supervise recreational periods; crossing guards supervise traffic safety procedures; study hall supervisors and homework helpers help with out-of-class study. (11)

c) Child care and pre-school aides -- thousands of these workers were successfully used in Project Headstart.

d) Rehabilitation work -- workers assisted the vocational rehabilitation professionals.

e) Homemakers are assigned to families where they provide information about maintaining a home and available community services; others assist social workers in their work.

f) Police-Community Relations aides work with families of younsters who are in trouble, make referrals, visit community groups, interpret community attitudes and reactions to the police. (7)

g) Public Health aides visit homes to interpret and encourage the use of health programs like vaccination; assist in referrals and on intake.

h) Recreation aides in parks, playgrounds and community centers assist professionals in organization of activities; work in community recruitment and organization of new activities.

i) Research aides are trained for household enumerations; interviewing; interpreting research goals and outcomes to the community.

j) Community Organization workers undertake organization of citizens groups, public housing groups, neighborhood councils and inter-group relations work. (19)

k) Planning aides work in community to interpret zoning regulations, renewal plans, referrals to service for relocation and housing information.

l) Probation aides assist professionals in work with probationers, work with teen groups for trips and recreation.

Other areas in which unskilled persons have been beneficial include corrections, social work, employment counseling, and legal services.

The State Office of Economic Opportunity project has also compiled a dictionary of over 400 job categories in state and local government. (2) They have pinpointed and described some of the administrative and supervisory problems associated with creating classes for these types of jobs. The State Personnel Board staff is currently working on the problem of creating new jobs for the poor in state services. Within a short time, using the techniques developed by these projects, a substantial number of specific requests from state, local and non-profit agencies could be compiled.

PROGRAM GOALS

There are two programmatic approaches to dealing directly with the problems of unemployed poor. The first, which characterizes most of our employment programs, holds that the poor must be prepared for employment and that this preparation best occurs through training, education and counselling services. As suggested earlier, this approach ignores the evidence which has given rise to the second view, viz., that the unemployed make best use of services available to them if they are employed. Too many programs promise jobs only conditionally (i.e., "if" a particular training course is taken, or "if" family stress can be relieved by counselling), even though there is little empirical correlation between the condition and the unemployed person's ability to perform the job. And even then, frequently there is no job waiting at the other end of the promise because either the jobs do not materialize or the preconditions make it too difficult to succeed. Often, the "if" should be preceded by a "perhaps", but we hesitate to qualify our promise in the fear that this will discourage participation in the program. But, many of the poor do not deceive themselves as easily; the dishonesty of these promises only serves to alienate the hopeful and embitter the alienated.

Job creation projects are immediately needed to produce models that bring into focus the problems, policies, and issues inherent in the development of a full employment policy. Most crucially, such models can clarify ways to involve major departments of state and local government, the largest potential employers of the

poor. To speak authoritatively about the implementation of a full employment policy, however, projects would have to work systematically toward the achievement of the following programmatic goals:

1. To determine the effect of having a job available for all who are willing and able to work.

2. To reduce the number of families with income below $4,000 per year by providing jobs for heads of households.

3. To find the best means of building these new jobs into the established employment systems of our public agencies.

4. To build and test programs that provide opportunities for the new workers to learn, grow and change. Opportunities for advancement and increased responsibility must be built into the program. This requires that there be:

   a) a system of in-service training, educational opportunities, and supervision which enables workers to be upgraded to higher positions in the agency;

   b) rewards and incentives which encourage and motivate workers to utilize these systems; and

   c) creation of a climate within public agencies which encourages and rewards their utilization of this manpower.

5. Meaningful jobs have social utility; a goal of job creation programs is to increase services to the low-income community by utilization of this available manpower.

ADMINISTRATION

Thus far, only some of the general problems to which massive job creation programs are relevant have been considered. An attempt is made below to identify more specific guidelines to program implementation. They derive from a review of the several job creation projects recently or currently active, as well as likely sources of support in governmental structure or operations. It must be pointed out, however, that the lack of national experience with programs that implement a full employment policy restrict the following to studied speculation.

1. Auspices

Suitable administrative agencies already exist in our present state agencies, such as the Department of Employment. Job creation programs could be implemented easily if resources of these departments were made available to support these programs. While many of our innovative programs have created discomfort within the established service agencies, the present ferment and community concern with lack of results can be used to demonstrate that, given the resources, public agencies can develop innovative models with which to build, develop, and change their own programs.

2. Administration

Other programs, such as the multi-service center program that is currently reorganizing social welfare, health, education, and employment services in California can also be utilized.

This program brings under one roof the services of many agencies which have heretofore operated as independent units with no legal-structural arrangements for coordination of efforts. Service facilities are located within the actual geographical centers of need, and the director of the program serves as a cabinet secretary under the Governor.

This kind of arrangement is an ideal one in which to locate job creation programs in that it reduces administrative costs and gives the programs ready access to a full range of supportive services for the new workers.

The task of developing a wide variety of jobs in a wide range of settings within a short period of time is a formidable one. Here, use can be made of the Cooperative Personnel Service of the State Personnel Board, as it is called in California, in working out job descriptions and supervisory and administrative arrangements. State Personnel Services have experience in providing this kind of service efficiently and quickly.

3. Recruitment and Selection

Recruitment and selection of new workers will require some new methods and techniques. The program should recruit from sources like community workshops, vocational rehabilitation, work experience programs, job corps, neighborhood youth corps, and other training programs, as well as from direct work with groups, organizations and churches which are indigenous to the communities in which they operate. Some of the new workers can be trained as recruiters to work in their own communities.

4. Basic Training

This initial part of the work experience should last for up to one month per worker.

Basic training can be done centrally; or, it could be contracted to an existing agency which can provide new workers with the help and knowledge they will initially need. (Basic training is a period in which the worker becomes oriented to the general work regime. It is a good screening and selection device that allows the agency to assess the workers' skills and abilities. It is also needed to give unskilled and inexperienced workers a chance to resolve, with or without help, some of the problems the new job creates for them before they are actually placed in an agency. These problems, attendant on their change in role, have included making family arrangements, dealing with the welfare agency, and paying outstanding debts to creditors.)

Basic training should stress activities which help the worker to prepare to perform on the job. Role-playing, short-term assignments, visits to community agencies, and discussions can be used effectively to do this. (18)

5. Employers

Most of the jobs can be newly created positions. Jobs can be developed with such agencies as Boards of Education, Recreation Departments, Youth Authorities, Probation Departments and Parks Departments. A wide range of positions should be available to employ the wide range of abilities of new workers.

Priority in the selection of employers should be given to those establishing jobs which are permanent, integrated into the regular agency operation and salary structure, and provide opportunities for advancement through training and supervision. The programs should deal with a wide range of agencies at all levels of government so that there is the greatest possibility to exercise such selectivity.(15)

6. Developing Jobs

Job development can occur through the following steps:

a) Evaluating the roles of the present skilled workers and professional incumbents of positions to identify those tasks of a sub-professional nature.

b) Identifying needed services which are not presently given and which a sub-professional can undertake.

c) Identifying a wide range of jobs so that each new worker can receive an assignment suited to his needs and abilities.

Workers should be hired for the program and paid a base salary when they are hired; employers should be given financial supports for administration, supervision and training. Assignments, based on worker readiness, might consist of one or more of the following elements: basic training; job orientation; entry level job assignments; in-service training; advanced training; and level II and III job assignments. Workers should receive salary increases as they move from level to another (i.e., from basic training, to job orientation, to entry job, to worker level II), according to the specific standards developed to clarify expected worker performance at each of these levels.

Previous experience suggests a number of random considerations to be important in developing employment situations:

a) all workers are hired by the program and, if they meet the requirements set for each position, they remain employed;

b) a basic training program should be available for all new workers and may last for from one to four weeks depending on the needs of the worker. Other kinds of supportive services should be available (through organizations like the multi-service center);

c) job orientation should be conducted by the employer (and considered part of the entry level assignment);

d) workers should be assigned to jobs by the following order of priorities:

(1) it meets worker's needs -- it is the maximum responsibility he can assume;

(2) it has the highest degree of social utility;

(3) it provides the worker with skills leading to other employment; and

(4) it represents the lowest proportion of administrative, supervisory and capital costs to wages for the new workers.

Workers needs and abilities can be assessed during the basic training period. As previously indicated, this orientation should be built around doing rather than using written tests. Workers should have a chance to actually perform in simple role-plays or short-term assignments. Workers should participate in evaluating their actual performance and assessing their strengths as a first step in their on-the-job training;

e) employers should be encouraged to work out job requirements for a classified position for which the worker can apply within the first year that he is assigned to the job. In-service training and supervision should be geared to helping workers meet these qualifications;

f) if the worker is hired by the employer in a classified position, the program might continue to pay the agency for his salary

for some specified period and also continue administrative, supervisory, and training supports to the agency during that period;

g) if the worker does not meet qualifications he should continue as an employee in the program and an alternate plan developed, (e.g., he might continue in-service training; special help might be offered to enable him to deal with areas in which he failed to qualify; a new assignment might be developed for him.) Programs will also have to deal with the worker who is unable to fulfill even the most minimal kinds of responsibility, as well as those able to utilize a formal educational program to move ahead in their field.

7. In-Service Training and Supervision

Responsibility for in-service training and supervision should rest with the employers. Employers should have responsibility for the worker after completion of a basic training program, with state agencies providing consultation and contract compliance machinery.

In-service training programs should help the worker develop his talents so that opportunities for advancement, wherever they exist, can be exploited. Verbal, theoretical and writing skills are best de-emphasized until new workers demonstrate readiness for these elements. Much greater stress should be placed on solving on-the-job problems. For example, role-playing is a good technique for reaching such workers. Language and math instruction should become a part of in-service training as they are needed by the workers on their job.

This kind of training program demands a strategy which will merge available training techniques with effective innovations (e.g., moving training and education out of the formal class-

room setting and closer to the job situation). The trainers themselves will require retraining as new models are developed.

Basic education and skills that are badly needed by the new workers should not be seen as merely remedial. Every effort should be made to cast them not as rehabilitation, but habilitation. The assumption should be that people can be habilitated and developed at any time. In light of the new educational technologies for developing literacy at all ages, the historic pessimism which surrenders hope on other than pre-school youngsters and sees all other assistance as merely remedial must be questioned.

The help of the staff of State, County, and City Personnel Boards should be utilized in working out training programs which are geared to the requirements of the jobs to be performed. The possible uses of adult education and junior colleges should be considered. During the first year, Level II and Level III positions should be developed for the second year of the program so that those workers who have demonstrated their ability can experience the success they have earned.

8. Research and Evaluation

Several different styles of research on these programs should be considered. In some cases research should be concerned with the effect of the program on individual workers, such as changes in their attitudes toward work, uses of their additional incomes, and changes in family life. In others, research should consider the effects of the program on employers, such as changes in their personnel systems and professional practices with and services for low-income people.

In smaller cities research might attempt to measure the effect of the income from these jobs on the low-income household sector of the community. This might include measuring the effects

of these monies on government transfer payments (largely welfare), the effects on the availability of and wages for jobs for other low-income persons and the degree to which this income is reflected in local expenditures, particularly as it influences small business development. The allocation of the new income which accrues to local small business is an empirical question of great importance. The "multiplier effect" this kind of increase has on a community's financial strength could have great economic development possibilities and should be measured.

Garrett, Pauline G.
Post-Secondary Education in Home Economics.

American Vocational Association, Washington, D.C.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - May67 25p.

*POST SECONDARY EDUCATION; CURRICULUM DESIGN; *OCCUPATIONAL HOME ECONOMICS; ADULT VOCATIONAL EDUCATION; SURVEYS; *CURRICULUM

A survey of State Supervisors was conducted to determine what materials are needed by those who develop occupational home economics curricula on the post-secondary level. The supervisors indicated that home economics education at this level serves (1) youth preparing for wage earning while completing high school graduation requirements, (2) dropouts, (3) high school graduates preparing for employment, (4) homemakers who were re-entering the work force, (5) adults who needed retraining or upgrading, and (6) youth and adults who had academic socioeconomic handicaps. Moreover, most curriculum guidelines proposed that post-secondary education (1) was part of a state-wide plan, (2) prepared for a wide range of occupations, (3) developed employment competency, (4) provided adequate facilities and equipment, and (5) utilized research to undergird and support program development. Post-secondary teachers usually have had courses in general-liberal education, home economics, professional education, and home economics education. Included in this report are: (1) subject matter to be covered in courses and approximate semester hours to develop competency for gainful employment, (2) transfer-credit in the major occupational areas, and (3) guidelines for initiating non degree wage-earning programs to train management aids in low-rent public housing projects, visiting homemakers, companions to the elderly, and child care aids. POST-SECONDARY EDUCATION IN HOME ECONOMICS

VT006343

. . . By 1970, an estimated 80 percent of all college-bound graduates will enroll in some type of two-year post-secondary program, junior college, community college or area school.

Material used here was collected by the Home Economics Publications Committee of the American Vocational Association and the booklet authored by Committee Chairman Pauline G. Garrett. Members of this committee include: Dr. Garrett, Chairman, Home Economics Education Department, University of Missouri, Columbia; Rita Youmans, Chairman, Home Economics Department, University of Wisconsin, Madison; Neva Jones, Head, Home Economics Teacher Education, Georgia State College for Women, Milledgeville; Edith Myers, Lakeview School, Stoneboro, Pennsylvania; Sara Ann Brown, Home Economics Teacher Education, Morgantown, West Virginia; Helen Wilson, State Supervisor, Home Economics Education, Boise, Idaho.

May 1967

Introduction

Home economics education has the immediate assignment of preparing students not only for home-making and family living but also for vocations using home economics knowledge and skills as a basis for gainful employment.

Presently, there is an ever-increasing demand for workers to fill an endless variety of jobs, many of which require knowledge and skills derived from courses in home economics.

To help meet the growing needs of the labor market, new home economics curricula providing occupationally-oriented experiences for students seeking immediate employment must be developed.

Although programs of this nature should be expanded at both the secondary and post-secondary levels, this publication will concern itself only with the post-secondary aspects. Experts have indicated that attention must be turned to this direction.

It is said by those who look at the projection of school enrollments that by 1970 an estimated 80 percent of all college bound graduates will enroll in some type of two-year post-secondary program, junior college, community college or area school.

In an article entitled "The Expanding Role of Vocational and Technical Education," Lane C. Ash, Assistant Director of the Bureau of Vocational, Technical and Adult Education, Office of Education, noted, "We are enjoined by these new programs (reflected by the many Acts of Congress during the period of 1961-1965) to continue existing high quality programs in vocational education, and to create opportunities for many more persons."

Mr. Ash also stated, "A balanced total program of vocational education will contribute greatly to the solution of many social and economic problems and it will provide much that is good to a great many who need assistance to achieve a satisfying life in the 20th Century period in time".[1]

Change a Factor

It is impossible to think about curricula and the school without reference to *change*. Changing socialization patterns of the family, the mobile family, changing technology, new products on the market and a host of other advancements in today's society affect the school and the curricula.

The home economics educator must be among those initiating change in educational programs thus enabling people to utilize constructively the knowledge and the techniques resulting from scientific, technological and societal developments. Free public education heretofore has focused on two primary objectives for the school. These were to provide opportunity for the child to realize his potential and to provide a literate citizenry. Today, there are three added objectives of equal importance.

[1]Lane C. Ash, "The Expanding Role of Vocational and Technical Education," *Counselor Education and Supervision,* VI, (Winter 1967), 84-90.

They are to provide a major avenue for social mobility, to prepare young people for the world of work and to develop an understanding and appreciation of the wide range of experiences, services and goods which can contribute to the national economy as well as to their own health and satisfactions.[2]

Need for Post High School Education
Using Home Economics Knowledge and Skills

With reference to these societal objectives, there are certain facts and trends which tend to emphasize the importance of education in occupations using home economics knowledge and skills.[3] Womanpower is one of our country's greatest resources.

Today 35 percent of all workers are women.

While 35 percent of all workers were women, 41 percent of all unemployed persons were women. (April 1965)

Most women are homemakers. One-third of all married women are both homemakers and workers.

Between 1947 and 1964, the number of women in the civilian labor force increased by 53 percent.

In recent years, the proportion of mature women in the labor force actually has exceeded the proportion of young women. This would indicate the increasing tendency of women to return to the labor force after their family responsibilities have lessened. In the age group 35 to 44, the number of women workers more than doubled between 1940 and 1965.

In 1947, 35 percent of women 18 to 64 years old were either working or seeking work. In 1964, this proportion had risen to 45 percent.

Working mothers with children under 18 years of age represent 35 percent of all such mothers in the population and 38 percent of all women workers.

Between 1940 and 1964, the labor-force participation rate of mothers increased about three times more than did the labor-force participation rate of all women. By 1964, 25 percent of those mothers with preschool children were in the labor force.

A survey (February 1965) by the Children's Bureau and Women's Bureau of some 6.1 million mothers with children under 14 years of

---

[2]Ralph W. Tyler, "Education in a World of Change," *Journal of Home Economics*, LIV, (September 1962), 527-533.

[3]Women's Bureau, *1965 Handbook on Women Workers*. Washington: U.S. Department of Labor (Bulletin 290), pp. 3-226.

age, showed 46 percent of the children were cared for in their own homes, 15 percent were looked after by the father, 21 percent by another relative and 10 percent by some paid person, who was not a relative. An additional 15 percent of the children were cared for outside their own home, about one-half of these were cared for by a relative. Thirteen percent were looked after by the mothers while they worked. Only 2 percent of the surveyed children were in group care centers. These preliminary findings would emphasize the urgent need for additional day care facilities.

The labor-force participation rate of women in the 45-54 year old group is projected at 59.5 percent for 1980. The rate in the 55-59 year group is projected at 56.2 percent in 1980.

The highest labor-force participation rate among women (March 1964) was for those with 5 years or more of college. The lowest rates of labor-force participation were among women with less than 5 years of schooling.

The most rapidly expanding occupations require the most education and training. These are: professional and technical requiring an average of 16.2 years of schooling; proprietors and managers requiring an average of 12.4 years of schooling; and, clerical and sales workers requiring an average of 12.5 years.

The population explosion continues to bring changes in the number of jobs available with new concerns for the working woman gainfully employed outside the home.

People working to an older age necessitates retraining.

The standard of living continues to rise.

Unemployment and lack of specialized and technical training are societal causes—lack of education is a barrier between people and jobs.

Manpower shortages exist in vocational, occupational, semi-professional and technical areas.

Sophistication and complexity of occupations increase as all employment levels increase.

People tend toward the realization that knowledge is the key to a better life—not just for a few but for many.

Integrative Factors

Post-secondary offerings are becoming more and more available for those who have completed or left the secondary school program. The enrollment in junior colleges has increased more than four times what

it was a decade ago. Instruction at the post-secondary school is designed for persons who have goals related to preparation for immediate entry into the labor market, as well as for those who are interested in pre-professional or general education and are working toward an associate degree or planning to transfer to a four-year college or university.

Problems of coordination arise from the nature of course offerings, professional qualifications of instructors, varying class schedules, increased travel requirements, as well as the nature of the placements, maturity of the students, and other conditions peculiar to post-secondary occupationally-oriented programs. Certain coordination problems may arise from a need for effective integration within the home economics occupational sequence of offerings and within related vocational service areas.

If each of the cooperating agencies in planning and evaluating curricula focused on gainful employment has comparable status, then communication between them is apt to be more effective. For example, the cooperating agencies might be a school and a commercial cafeteria. The main communication lines might be between the school administrator and the cafeteria manager, but there would also be a continuing operational relationship among the staff personnel who actually conduct the educational program. This allows for specific representatives of each cooperating agency to speak with an equal degree of authority and to keep other staff members informed. This relationship of cooperation contributes to and encourages continuing communication to benefit all involved agencies which are equally concerned for the potential employee and his success on the job.

The scope and emphasis in post-secondary programs in home economics focused on gainful employment are similar to their secondary school counterparts. Among the most significant similarities are:

Systematic school-and-work schedules, interrelating class experiences and on-the-job responsibilities.

Kinds of training offered and the kinds of employment available, relating both the instructional content and standards of the training and the duties of the job.

Specialized training programs for related groups of occupations, as well as specific kinds of jobs within occupational groups.

Training programs emphasizing the development of specialized knowledge and skills in human relations, group responsibility, and preparation for advancement on the job.

Representative advisory committees which reflect business, school, and community interests and assist in planning and developing programs focused on gainful employment.

Committed enrollees whose aptitudes, objectives, and potentialities are relevant to occupational choices using home economics knowledge and skills.

Teachers whose qualifications are based on adequate and appropriate background of general education, technical-vocational education, and wage-earning experience in home economics related occupations.

Policies which allow school credit for the combined program of learning experiences in class and on the job but allow no credit for one without the other.

The post-secondary programs often provide instruction for advanced specialization as well as technical supervisory and managerial responsibilities.

Usually there can be flexibility in post-secondary programs focused on gainful employment. By their very nature, they can serve wide geographical areas. Specific programs can be offered periodically and rotated with programs characterized by an uneven flow of trainees.

In most cases, the public post-secondary school, including occupational programs, represents rather a large population sample with a rather extensive budget directed toward acquisition of facilities appropriate to meaningful educational and work-related experiences. True, post-secondary school centers provide an ideal way through which programs in general home economics for both men and women may be provided in areas of study related to food and nutrition, child development, human relations, consumer economics, family finance, management, selection and care of the house, home furnishings, and clothing. It is also true that these programs at the post-secondary level might be extended as special interest or short-term programs to other adults of the community.

Preliminary to Action

Questionnaire

The foregoing presents undeniable evidence that pertinent material must be made available to those who are responsible for developing occupationally-oriented post-secondary curricula.

The Home Economics Publications Committee of the American Vocational Association felt that information concerning programs presently being operated in the states would be of value.

The Committee sent a questionnaire to State Supervisors of Home Economics inquiring about offerings at the post-secondary level. The suggestions in this bulletin highlight the returns from the questionnaire. The Publications Committee chose to give major emphasis to ideas related to programs focused on gainful employment.

Objectives Accepted

The majority of the home economics educators responsible for occupationally-oriented programs accepted the following objectives along with others unique to their local areas:

1. Prepare enrollees, both men and women, for the responsibilities of citizenship at home and at work.

2. Expand educational opportunities in home economics at all levels in keeping with social and economic changes and needs of our society.
3. Increase the employability of older youth and adults by providing them with vocational and technical training along with useful work experience.
4. Strengthen and improve the quality of existing programs in vocational, semi-professional and technical education. Wherever and whenever feasible, using an interdisciplinary approach to program planning.
5. Develop new programs of a vocational, semi-professional, and technical nature in keeping with anticipated changes in the labor market and new economic developments in our society.

Types of Institutions and Groups To Be Served

In reviewing the responses from the questionnaire, it was noted that many states had conducted occupational surveys before initiating programs for the purpose of meeting present and future needs in post-secondary education. They identified the needed body of knowledge as well as skills for successful employment. The continuing demand for professionally and technically-trained personnel in home economics was clearly indicated where such surveys were made.

The groups, both men and women, being served in post-secondary occupational education in home economics included:

Youth who wished to prepare for wage earning while at the same time completing requirements for high school graduation.

Youth who had dropped out of school before graduation from high school and wished to return to prepare for employment.

Youth who had completed high school and who wished to prepare for employment through vocational training.

Youth and adults who wished intensive occupational training to enable them to get a job as quickly as possible.

Homemakers who had never been employed outside the home and who were entering employment for the first time.

Adults who needed retraining for an occupation because previous training was obsolete or outdated.

Adults who wished training to upgrade their current level of employment.

Youth and adults who had academic socio-economic handicaps which necessitated special kinds of training for employment.

Operational Guidelines in Home Economics for Gainful Employment

No matter what type of curricula were used in the occupationally-

oriented home economics programs, as indicated in the returned questionnaires, there seemed to be selected guidelines for planning and evaluating the curricula. For the most part they were similar to those suggested by Dr. Berenice Mallory, Chief, Home Economics Unit, Occupations Section, U.S. Office of Education, in a paper presented at a National Leadership Seminar on Home Economics Education, March 28-31, 1966, at The Center for Vocational and Technical Education, Ohio State University, Columbus. The considerations she presented in developing post-high school occupational education were:

1. *Providing a state-wide plan for post-secondary education*—The functions of the different types of educational institutions available to provide training after high school need to be identified clearly so that their potential in a state-wide plan can be measured. For example: community colleges may concentrate effort on parallel college programs and be concerned primarily with transfer courses. Other institutions may emphasize occupational programs, and still others may serve the dual purpose of providing vocational curricula for jobs and parallel college programs. Some technical institutes may offer curricula totally specialized in job skills and knowledge, while others may require a core of academic courses in the occupational program.
2. *Providing preparation for a wide range of occupations*—The post-high school curricula should provide preparation for occupations ranging from the less complex to those requiring sophisticated competencies.
3. *Achieving the primary purpose—employment competency*—Occupational curricula in post-high school institutions should have as their primary purpose the achievement of competencies needed for employment, growth and flexibility in a specific job or job cluster.

   Reimbursable post-high school vocational education by law is limited to job preparation not requiring a baccalaureate degree. Courses are to be made available to individuals whose vocational intent is a matter of record and whose employment objectives may be classified as semi-professional or less. Vocational education which is designed as a part of a four-year bachelor's degree curriculum, therefore, is not part of the reimbursable program.

   However, it should not be the purpose of post-high school vocational education to restrict the educational ambitions of those enrolled in the organized curriculum being completed. On the contrary, the nature of the employment and individual potential for growth make it imperative that further education, whether in vocational or adult classes or under other auspices, be emphasized as a fact of work life.

   Some community colleges and technical institutes which receive

vocational funds have open-end programs which include arrangements for selected students who are enrolled in occupational curricula to transfer to a bachelor's degree program with little or no loss of credit. The problem, however, is to avoid weakening the occupational preparation in order to protect the transfer status of the students who will continue their formal education.

Institutions that provide such opportunities for transfer must be sure that the following safeguards exist: (1) each occupational curriculum is designed to achieve, without compromise, competencies needed for employment, growth and flexibility within a specific job or job cluster; (2) students enrolling are aware of the extent and purpose of the occupational curriculum.

Whatever organizational patterns are determined to be appropriate by an institution, the vocational integrity of the offering must be evident. This will be the case when the controlling objective is to develop those competencies needed to get, to hold and to grow in the jobs for which the curricula have been planned.

4. *Providing adequate facilities and equipment*—Equipment and facilities for post-high school occupational education should be such as to attract prospective students as well as to enhance the quality of instruction. It is an oversimplification to say that the equipment and facilities stimulate interest in post-high school programs. However, there is little doubt that up-to-date equipment in operation, facilities that simulate employment conditions and students learning in a job environment act as a magnet for enrollment.

   It is not enough just to make vocational curricula available. They should occupy appropriate locations in the school plan, and the equipment facilities and library should be up-to-date and sufficient to provide quality programs.

5. *Utilizing research to undergird and support program development*—Research activities should have an important role in the development of post-high school programs for job preparation.

   Ideally, every aspect of post-high school vocational education should feel the impact of research activities. Some areas which seem to merit priority treatment are: (1) the articulation of post-high school curriculum with job training provided in secondary schools; (2) patterns for cooperative training or supervised work experience in post-secondary programs; (3) curricula to prepare for jobs requiring skills or knowledge overlapping two or more vocational fields; (4) variations in scheduling appropriate to the vocational objectives for post-high school students.[4]

---

[4] Berenice Mallory, *Development of Post-High School Programs*, A Report, National Leadership Seminar on Home Economics Education, March 28-31, 1966. Program Development for Occupational Education, The Center for Vocational and Technical Education, The Ohio State University, Columbus, Ohio. pp. 50-52.

Teacher Education

Teacher educators directly or indirectly involved in post-secondary programs accept the statement made by the Home Economics Education Branch, Division of Vocational and Technical Education:[5]

> "An increasing number of women now assume a dual role—that of homemaker and wage-earner. They need preparation for both roles since the proficiency with which a woman can carry both will determine the quality of her home and family life and her effectiveness as a wage-earner.
>
> "The purpose of vocational education in home economics which is directed toward gainful employment provides instruction that qualifies individuals to engage in occupations involving knowledge and skills in home economics subject-matter areas, i.e., child development, clothing and textiles, food and nutrition, home and institutional management, home furnishings and equipment, etc. Included are such occupations as those which provide services to families in the home, and similar services to others in group situations; those which provide assistance to professional home economists and professionals in fields related to home economics in business, agencies, organizations, and other occupations directly related to one or more home economics subject-matter areas."

Teachers of post-secondary programs usually have had courses of varying preparations in general—liberal education; home economics, professional education, and home economics education.

The course work is planned to supplement successful work and work-training experiences. Individual state plans usually reveal a particular framework for teachers of occupationally oriented courses.

Advisory Committees

In the occupationally-oriented home economics programs, it is imperative that an advisory committee assist with the planning and evaluating of the offerings at the post-secondary level. An advisory committee usually includes representatives from professional men's and women's groups, business and industrial groups, health and welfare organizations, employment services and homemakers. It is highly desirable that the professional home economists be represented on such committees.

The responsibilities of the advisory committee might well include such duties as:

Assist with occupational surveys (community, region or state),
Review occupational needs and opportunities,

[5] Bureau of Educational Assistance Programs, Division of Vocational and Technical Education, Home Economics Education Branch, *Preparation for Employment in Occupations Utilizing Home Economics Knowledge and Skills as Provided in the Vocational Education Act of 1963*. Washington: Department of Health, Education, and Welfare (April 3, 1964).

Assist in selection of appropriate programs to be included,
Assist in planning the various curricula,
Advise teachers and cooperating staff,
Assist in interpreting, promoting and evaluating the offerings,
Support the program in terms of efforts directed to such problems as appropriate space, facilities, instructional materials and adequate budgets.

Selected Course Patterns

Emerging positions on the job market indicate the following areas as the major ones utilizing home economics knowledge and skills:

Care and Guidance of Children
Clothing Management, Production, and Services
Food Management, Production, and Services
Home Furnishings, Equipment, and Services
Institutional and Home Management and Supporting Services

The criteria used as a guide for the various instructional programs were quite similar to those identified in the bulletin, "Occupational Criteria and Preparatory Curriculum Patterns in Technical Education Programs" (OE-80015).

The following listing of home economics courses and course outlines in five of the occupational areas of home economics mentioned previously may give direction to administrators and teachers concerned both with the post-secondary school curricula focused on gainful employment and an interdisciplinary approach to planning curricula at the post-secondary level.

Although the reports from the states did not indicate the extent of planning between the various vocational services, the Home Economics Publications Committee recommends that consideration be given to an interdisciplinary approach for all of the following curricula. Most of the curricula led to an associate degree.

Care and Guidance of Children

The course outlines in Care and Guidance of Children as submitted by several junior and/or community colleges responding to the committee's questionnaire would suggest the following topics within the courses offered at the post-secondary level:

Concepts and Theories of Child Growth and Development.
Life Begins.
The New Born.

The Preschool Age Child.
Human Growth and Development.
Physical Needs of the Growing Child.
Motor Development.
Intellectual Development.

Emotional Development.
Social Development.
Children's Play.
Child-adult Relationships.
Personality Development.

The following are some of the behavioral goals identified for the child development area if the curriculum is to be focused on the development of appropriate attitudes and the attainment and use of knowledge and skills appropriate to gainful employment:

Shows interest in the stages of physical, mental, emotional and social growth of children.

Relates knowledge of human growth and development to the observation experiences and to the supervised laboratory experiences within the "Child Study Center," Day Care Center, Nursery School, etc.

Is able to provide alternatives in the selection of facilities within the "child study center" appropriate to an effective learning environment for the young child.

Participates, under supervision, in skillful care and guidance of children with emphasis on meeting needs of the nursery school or prekindergarten age child.

Recognizes and carries through on selected responsibilities delegated by and for a nursery school assistant.

In addition to some 30-34 semester hours in the major area of Child Development, including extensive practice in laboratory experiences with young children, most of the post-secondary curricula included the following areas of study for a Nursery School Assistant or similar position.

Courses	*Approximate semester hours*
English and Speech	9
Fine Arts	6
Mathematics	3
Nutrition	5
Psychology	6
Sociology	3
Health and Physical Education	4

Fashion Design and Merchandising

In this particular area of study, the course outlines submitted by the several junior and/or community colleges would suggest the following topics:

Wardrobe Planning; Fashions; Dress Design, Color.

Consumer Buying of Ready-made Clothes (Fiber, Fabric and Finish).
Equipment and Facilities.

Construction Techniques; Tailoring.
Foundation Patterns and/or Flat Pattern Design.
Basic Principles of Draping.
Alterations.
Salesmanship; Shop "Talk."
Clothing Publications (Commercial; Professional).
Fashion Shows; Display Design.

The following limited listing of behavioral goals might be suggested for the Fashion Design and Merchandising Area if the courses are focused on gainful employment:

Is aware of the need to develop consumer purchasing skills.

Shows an interest in the needs of both the customer and the business being represented.

Demonstrates effective selling techniques.

Recognizes the need for understanding the properties and functions of the varied array of textile products on the market.

Uses authentic sources of current information related to textiles and textile finishes.

Recognizes the elements of color and design relative to figure types in the clothing market.

Exhibits skill in applying creative design details.

Shows evidence of effective judgment in the selection of clothes as a buyer and/or seller of clothing merchandise.

Shows ability to evaluate clothing inventories.

Shows ability to apply criteria in the fitting of clothes as a buyer and/or seller of clothing merchandise.

Most of the post-secondary curricula included, along with on-the-job experiences, the following course groupings:

Courses	*Approximate semester hours*
Art; Art History; Color and Design	14–16
Construction; Clothing Selection; Textiles	12–14
Communication; Speech	6
Merchandising and Marketing—Buying Mathematics; Stock Control; Salesmanship	14–16
Psychology	3
Social Sciences	6

Interior Design

The course outlines in the area of interior design appeared to emphasize the following topics:

Aesthetic Values.
Functional Planning of Interiors.
Background Features of Rooms.
Lighting.

Furniture Selection and Arrangement.
Furniture Styles.
Trends and Influences.
Accessories.

Any course or series of courses in this respective area, if planned with an occupational focus, could give some consideration to the following behavioral goals:

Is aware of the power of advertising media in both buying and selling.

Recognizes responsibilities associated with the work of the assistant to an Interior Designer.

Cooperates with professional interior decorators in in-service educational programs related to problems of "Merchandising."

Demonstrates ability to create well-designed color groupings functional and significant for individuals and families seeking assistance with interior design problems.

Shows ability to effectively communicate with those seeking assistance in the use and arrangement of interior space.

Demonstrates effective judgment in terms of personal integrity as assistance is given to benefit both the customer and the owner of the business for whom the assistant is working.

Most of the post-secondary curricula, including on-the-job experiences, gave attention to the following course groupings:

Courses	*Approximate semester hours*
Art and History; Color and Design	18
Communication; Speech	6
Interior Design	6
Merchandising and Marketing — Stock Control; Buying Mathematics; Salesmanship	20–24
Psychology	3
Social Sciences	6

Food Management, Production, and Service

The course outlines relative to this particular area of study as pre-

sented by the respondents to the committee's questionnaire seemed to emphasize the following aspects:

Food Service Organization and Work Techniques; Food Management.
Principles in Handling and Storage of Food.
Preparation of Foods; Menu Planning.
Foundation Recipes.
Cafeteria Food Service.
Restaurant Management.
Catering.

Conservation of Nutritive Values.
Standards for Finished Products.
Quantity Purchasing; Institutional Food Service.
Developments in Food Processing.
Selection and Purchase of Commercial Equipment for Quantity Cookery.
Food Cost Control.

If the enrollees are preparing themselves for gainful employment, the following behavioral goals could be among those toward which to focus the course or courses in this field of study:

Recognizes effective and appropriate cookery procedures essential to commercial food service establishments.

Demonstrates proficiency in the preparation of foods on a quantity basis as well as the purchasing of foods on a large scale.

Exhibits harmonious and cooperative working relationships with others on the job.

Gives evidence of acceptance of delegated responsibilities related to the various facets of food service.

The course outlines in this entire area were related to many positions as well as specific food service in a hospital, a school, a restaurant or some similar institution. Curricula reviewed showed the following:

Courses	*Approximate semester hours*
Nutrition and Health	4
Communications and Speech	6
General Education (Chemistry, History, Health, Government, Physics, Accounting)	24

Floral and Landscaping

Aspects of the Floral and Landscaping curricula seem to include:

Home Economics	*Approximate semester hours*
Housing Design	3
Design Fundamentals	3
Landscape Appreciation	3
Housing the Family	3
Practical Problems in Exterior Decoration	3
Agriculture	
Home Horticulture	3
Landscape Design	3
Landscape Construction	3
Soils	3
Nutrition; Plant Environment	3
Flowers and Plants	3
(Field Training—4-6 semester hours, jointly planned and supervised)	
Additional Courses To Include:	
Communications and Speech	4–6
General Education	18–24
(Chemistry, Botany, Mathematics, and Accounting)	

On-the-job Training

As reported, on-the-job training was an integral part of all the post-secondary home economics occupational training programs. The curricula of the institution combined intensive on-the-job training in co-operation with a variety of commercial concerns. According to the reports, the student developed many skills as he worked with equipment and problems peculiar to the position for which he was qualifying. With this arrangement, a large segment of the in-service training was provided by the employing agent or agency, with supervision from the educational institution.

Initiating Selected Non-degree Programs

In addition, reports from State Supervisors indicated guidelines for school administrators and staff in initiating wage-earning programs.

The following outlines from the Office of Education—*Management Aide in Low-rent Housing, Visiting Homemaker, Companion to the Elderly*—provide some indication of directions taken in these occupational areas.

Management Aide in Low-rent Public Housing Projects (OE-87001)

Assists the Housing Manager of the Local Housing Authority in orienting residents in housing projects to living in a new environment and making effective use of personal resources, and the facilities and services provided in the project, and the community, in achieving satisfying family life.

Explains housing regulations to new tenants and demonstrates proper use and care of all installed equipment; shows location of project facilities, such as laundries and playgrounds; provides information to homemakers who need assistance with sanitary housekeeping practices; plans schedules, or instructs homemakers in care of children; provides information to tenants on location and services available from community agencies, such as health services and adult education or recreation centers; keeps records and prepares reports to the Housing Manager. (Suggested hours of training—360.)

The following suggested time for each of the three units may be used as a guide for planning the course to meet trainee and community needs.

Course Unit	*Title*	*Approximate clock hours*
I	Achieving Effective Working Relationships With People	90
II	Assisting Tenants With Family Living Problems and Life Within the Housing Project	192
III	Additional Tasks of the Management Aide	78
	Total	360

Visiting Homemaker (OE-87002)

Assists in maintaining normal family life when the mother must be away or the family is under the stress of an emergency. Carries out directions from the welfare or health agency which may be in charge. Helps maintain family routines and activities. Helps children have a sense of security through sympathetic understanding. Supervises the play and rest of children. Prepares or assists family members in preparing simple, nutritious meals. Helps do light laundry work and keeps house clean and orderly. (Suggested hours of training: 60-90; 100-180 in-service.)

A basic course of not less than 60 hours is suggested for the training. An expanded course may be offered for trainees who will be employed in families with more complex problems or for those trainees with limited backgrounds.

The following suggested range in hours for each of the six units can be used as a guide for planning a course of 60-90 hours.

Course Unit	*Title*	*Approximate clock hours*
I	Orientation to the Nature of the Work and Personal Qualities Important to Strengthen	2–4
II	Responsibilities of the Visiting Homemaker And the Professional People With Whom She Works	5–10

III	Basic Needs of People and Some Implications of Working With Children of Various Ages and Families of Different Types	25–40
IV	Working With Families Where There Are Special Problems	15–25
V	Assisting the Family in Providing Nutritious Meals	4–10
VI	Housekeeping Tasks	4–8

Companion to an Elderly Person (OE-87006)

Serves as an aide to elderly or convalescent persons, either full-time or part-time. Prepares and serves the person's food; answers the telephone; helps with correspondence; assists with personal grooming; keeps surroundings tidy; helps to keep the person occupied by reading, conversing, and playing games; accompanies the person to the doctor's office or elsewhere to secure medical attention; shops and runs errands; and, on occasion, accompanies the person on walks, on visits to neighbors, to church or to the movies. (Suggested hours of training, 150.)

Course Unit	*Title*	*Approximate clock hours*
I	Orientation to the Nature of the Work and Interpersonal Relations	10
II	Some Common Physical, Mental, and Emotional Needs of the Aging, and Their Implications for Giving Satisfactory Service	65
III	Assisting With Personal, Social, and Business Matters	70
IV	Handling Emergencies	5
	Total	150

Home Economics in Adult or Service Curricula Of the Community College

(*Non-degree Programs*)

Both the interests and the needs of the community residents were served by the non-credit service offerings. Courses varied in length from a few weeks to a semester. Within the limits of time and qualifications of instructors available, the courses or units covered a wide range of topics.

The following are examples of the non-credit service courses which a community college might offer in home economics:

Child Day Care

Courses offered spring, 1966, Adult Vocational Home Economics Education, Hoke Smith Technical School, Atlanta, Georgia.

Basic 1—An Introductory Course to Child Day Care, with emphasis on program as it relates to children's growth and development. This is a repeat course. All Child Day Care workers are eligible to attend. *60 hours.*

Students who have received a certificate from Basic 1 or its equivalent may register for the following courses:

Basic 2—Ways of Working With Children—The teacher's role in understanding and meeting needs of preschool children in groups. *30 hours.*

Infants in Day Care—Infants in groups require special planning, program, and equipment. This course will consider the needs and characteristics of infants from birth until the time the child has started to walk, including creeping and crawling. *30 hours.*

Toddler Care in Day Care—Covers the care of children from walking until the child is developmentally ready for group care (12 months to 2½ years, approximately).

The School-age Child in Group Care—Providing good program for the school-age child in group care. *30 hours.*

Short Term Community Courses:

The Child in Day Care: A look at his special needs, such as separation, discipline, being an individual, etc. *12 hours.*

Day Care and the Family: Day Care Center workers to explore how they can better help their children through work with parents; a study of the American parent in a period of change. *12 hours.*

General Information

Requirements for Enrollment:

Basic 1 Day Care Course—all child day care workers are eligible.

All other courses—student must have received certificate from Basic 1 or its equivalent.

Commercial Home Economics

Courses offered, Portland Community College, Portland, Oregon.

HE 10 Nursing Aide Training

For Nursing Aides now employed in nursing homes this course provides instruction and practice in the fundamental techniques and procedures involved in nursing home care. A 36-hour course, meeting one night a week for 12 weeks.

Power Sewing 3-990

Classes run continuously in training for employment in the garment industry. The minimum course, to develop skill in operation of the power machine, consists of 120 hours of instruction, but additional time may be needed to develop the necessary speed. An advanced

course is available for those wanting skills in more difficult construction techniques.

Clothing Alteration Specialist

A course to prepare experienced seamstresses for employment in dress shops, department stores, dry cleaners or private business. Training includes practice in basic repairs, fitting, altering and restyling, power machine operating and altering and repairing men's clothing, as well as information on the care and handling of fabrics. 300 hours, 10 weeks.

Training for Workers in Day Care of Children

A training program for women interested in working with children in day care centers, homes, and all other places where care of preschool children is provided. Included will be the use of art materials, stories, music and science; the needs of children and how to meet them; how children develop; and, selection of materials and equipment. 48 hours class; 36 hours observation and practice.

In-service Class for Day Care Teachers

A course for those regularly employed in preschool group care. Content is adapted to the group and includes guidance and discipline, understanding behavior patterns, growth and development, creative experiences for children, and special problems of teachers. 3 hours, 10 weeks.

Space and Equipment

Adequate space and equipment for laboratory work, whether for training for occupations or for college transfer, terminal or service curricula, will be needed. Since all of the wage-earning courses will be concerned with developing skills for which laboratory exprience is required, the curricula being offered will determine the laboratory space and equipment needed.

Essential minimum facilities for offering instruction in area vocational schools, community colleges or junior colleges include:

Readily available film projectors, recorders, record players, and other equipment for using audio-visual materials;

Classrooms equipped for use of audio-visual aids;

Library facilities of sufficient quantity and quality to permit standard work at the community or junior college level in the areas of home economics offered for credit by the school;

Mimeographing and/or duplicating facilities.

Facilities for specific instruction in home economics related to each of the occupational areas listed.

In the January, 1966 issue of the AMERICAN VOCATIONAL JOURNAL,[6] Miss Ata Lee, Regional Representative of the Office of Education, discussed minimum space in relation to home economics education departments in area vocational schools, community colleges and other post-secondary programs with curricula focused on gainful employment.

Two bulletins from the Office of Education, Department of Health, Education, and Welfare, are valuable to persons legally and specifically responsible for planning facilities. They are *Basic Planning Guide for Vocational and Technical Education Facilities* (OE-80040) and *Planning Functional Facilities for Home Economics Education* (OE-83015).

Conclusion

Questionnaire response indicated that current occupational surveys had given direction to the selection of content and practices within the post-secondary school offerings. It was clear that most states were rapidly moving ahead with their occupationally-oriented post-secondary curricula.

This bulletin can serve as a qualified and dynamic approach in designing curricula using home economics knowledge and skills in gainful employment—whether the offerings are in area vocational schools, junior colleges or community colleges.

Post-secondary education in home economics focused on occupationally-oriented curricula is an "imperative in education."

[6] Ata Lee, "Minimum Space-Maximum Use," *American Vocational Journal*, IV (January 1966), 23-25.

This chart represents a spring schedule (March 16-June 1, 1966) of the Adult Homemaking Department, Dudley M. Hughes Vocational School, Macon, Georgia. It includes classes for training in wage-earning* and classes for regular adult homemaking.

Time	Monday	Tuesday	Wednesday	Thursday	Friday

*VOCATIONAL EDUCATION; *PROGRAM DESCRIPTIONS; JUNIOR COLLEGES; ADULT VOCATIONAL EDUCATION; SECONDARY SCHOOLS; STATE PROGRAMS; GOVERNING BOARDS
MISSISSIPPI

The purposes of this document are (1) to provide industrialists with information about vocational and technical training programs oriented toward employment purposes, and (2) to inform those interested in industrial employment where to enroll for training to meet their needs. The state's 82 counties are divided into 17 public junior college districts in which state funds provided on a 50-50 matching basis with local funds have provided 17 new vocational and technical training centers as of 1967. Over 39,000 students are enrolled in some phase of vocational or technical education throughout the state. There were 52 different types of vocational and technical education courses offered at the junior college level in the 1966-67 school year. (MM)

Pursuit of Excellence

MISSISSIPPI'S COMPREHENSIVE VOCATIONAL AND TECHNICAL TRAINING PROGRAM

VT006457

MISSISSIPPI AGRICULTURAL & INDUSTRIAL BOARD
JACKSON, MISSISSIPPI
1967

Dedication

This publication is respectfully dedicated to the Honorable Paul B. Johnson, Governor of Mississippi. The "pursuit of excellence" of his administration has revitalized Mississippi's vocational and technical education and made it an integral part of the state's move into a new era of economic progress.

Greetings:

The economy of Mississippi is now experiencing a dramatic and beneficial transformation and expansion. Industrial growth is a fundamental element of this change and Mississippians are committed to doing everything possible to continue and accelerate the state's progress.

Vocational and technical education is, therefore, of vital importance to Mississippi. We are pledged to provide the people of our state with the best possible education and training to fit them for our new industrial era. We are determined to offer industry a comprehensive training program that fits its needs both today and tomorrow.

Mississippi is moving forward rapidly. Its vocational and technical training system is designed to provide new impetus to this progress.

Paul B. Johnson
Governor

Millard Bush,
Director,
Mississippi A & I Board

Preface

The Mississippi Agricultural and Industrial Board, created by law as the state's agency for economic development, is keenly aware of the importance of quality vocational and technical training in Mississippi. Also, it is concerned with every area of the state's economic growth and development, particularly so in the location of new industries and the expansion of existing ones.

As a result of the state's legislative efforts, the Vocational and Technical Committee of the A & I Board, and the Vocational Department of the State Department of Education, Mississippi is now placed in a more favorable position to meet the need for a trained work force suitable for agricultural and industrial employment.

Therefore, the intended purposes of this publication are: (1) to provide industrialists with factual information about vocational and technical training programs in Mississippi oriented toward employment purposes; and (2) to inform all Mississippians interested in industrial employment where to enroll for vocational and technical training that will meet their needs.

Pursuit of Excellence

an Introduction

William S. Cobb, Director
Youth Affairs and Training
Mississippi A & I Board

Since 1961 the economic growth rate of Mississippi has climbed sharply and steadily. A major reason for this has been the continued location and expansion of industry within the state. In 1965 manufacturing became the largest single category of employment in Mississippi and its lead has continued to increase.

New and expanding industry demands good, dependable, *trained* workers. Mississippi is attempting to meet this demand through a comprehensive program centered in the state's public junior colleges and reaching into both the universities and senior colleges and the secondary schools. Specialized programs adapted for specific industries and plants supplement this basic approach to vocational and technical training.

In short, the state's goal is to provide the quantity and quality of trained workers needed today and tomorrow. Already tremendous progress has been made toward reaching this goal. In keeping with Mississippi's ambitious and far-reaching economic development work, vocational and technical training is a continuing "pursuit of excellence" for the state.

In a policy speech delivered to a joint session of the Mississippi Legislature in January, 1964, Governor Paul B. Johnson called for a stepped-up program of vocational and technical training which would answer industry's needs and enable Mississippians to "earn larger incomes for themselves, achieve a better material existence for their families and make a greater contribution to the total productivity of the state and nation."

Governor Johnson said: "I am convinced that the quickest, best and least expensive answer to Mississippi's needs in vocational and technical training lies in utilizing our public junior colleges for this purpose."

Mississippi's 82 counties are divided into 17 public junior college districts which serve all geographical areas of the state. For many years they had labored to provide Mississippi with vocational and technical training but increased student enrollments, industry demands and rising costs required new and additional physicial facilities and updated support.

Following Governor Johnson's recommendation, legislation was enacted which provided state funds (on a 50-50 matching basis with local funds, to supplement any other funds made available) to public junior colleges satisfying the requirements of the Mississippi Junior College Commission, the State Building Commission, and the Mississippi Agricultural and Industrial Board.

Additional state funds helped the public junior colleges to take immediate steps to improve their vocational and technical training programs. Ten new vocational and technical training centers were put into operation in 1966 and seven more are scheduled for completion in 1967.

These new centers incorporate the most efficient and modern equipment and instruction possible. They are planned and operated to fulfill the needs of industry, students, and the state. In addition they focus public attention on the dramatic importance of industry and education in Mississippi's economic advancement. They supply a physical expression to the spirit of progress demanded in today's Mississippi because of its ambitions and potentialities. They demonstrate to industry the state's serious commitment to programs which will support and accelerate industrial growth.

The new public junior college training centers are indeed the focal point of vocational and technical education in Mississippi today, however, the role of the state's secondary schools must not be overlooked. They provide sound and valuable training to thousands each year and are an integral part of the state's system of training for industrial work.

The programs and facilities of the public junior college centers, the secondary schools, and the supplemental and additional training programs offered in Mississippi are described in more detail on the following pages. Specific inquiries concerning any of these may be addressed to the Director, Mississippi Agricultural and Industrial Board, State Office Building, Jackson, Mississippi, or to the Director of Vocational Education, State Department of Education, State Office Building, Jackson, Mississippi.

William S. Cobb, Director
Youth Affairs and Training
Mississippi A & I Board

THE STATE BOARD FOR VOCATIONAL AND TECHNICAL EDUCATION

The State Board for vocational and technical education is dedicated to the task of providing education and training for every boy, girl, man and woman in the state that will enable them to make their greatest contribution to our society. Through the efforts of the State Board, and as a result of the Governor's interest and the State Legislature's desire, local, state and federal funds are being provided to give all Mississippians the opportunity for such training.

The Board's vocational and technical education staff works closely with secondary schools, public junior colleges and the Mississippi Agricultural and Industrial Board in developing training programs that will meet the occupational needs for a trained work force. Mississippi's vocational and technical programs begin with pre-vocational courses in junior high schools, and continue through the high schools with vocational programs and our comprehensive junior college system with the advanced vocational and technical education programs.

High schools and junior colleges also conduct preparatory and supplementary adult programs to retrain or up-grade adults for the higher level employment opportunities in their area. Vocational and technical job training can be tailored to meet all existing and future needs because of the flexibility afforded through local school board control and the cooperation of the State Board for vocational and technical education.

All existing facilities are used to meet the total job training needs. Vocational agriculture shops are primarily in rural schools and are being used to equip thousands of rural youths with marketable skills for farm and off-farm agricultural occupations. Many larger secondary schools have initiated comprehensive and effective vocational programs. Junior college facilities valued at millions of dollars are being put to maximum use. When present construction plans are completed and instruction is begun, virtually every area of the state will be able to meet their training needs.

Expansion in vocational and technical training programs has increased enrollments to 110,000. The greatest increases occured in trade and industrial, and business and office education.

J. M. Tubb
Superintendent of Public Education

Heber A. Ladner
Secretary of State

Joseph T. Patterson
Attorney General

A. P. Fatherree
State Director
Vocational-Technical Division
State Department of Education

Programs will continue to be developed in all geographical areas to meet the occupational needs. Pre-employment training can be provided for new or expanding industry. Supplementary training may also be provided for up-grading personnel for any occupation in the state.

The State board contracts with the universities and senior colleges of Mississippi in a program of teacher training in an endeavor to provide a core of well qualified vocational and technical teachers.

Through a cooperative arrangement with the universities and senior colleges vocational and technical teachers are trained in all areas of vocational and technical education. This includes pre-service and in-service training. This training is done under the supervision of the State Board for Vocational Education. An attempt is made to prepare the teachers in the knowledge and skills that are required by teachers of vocational and technical education subjects. Technical advisory committees are used to help determine curriculum and course outlines for such training.

In addition to the training of teachers, the State board, through a cooperative arrangement with Mississippi State University, develops curriculum materials and teaching aids. These are prepared and distributed for use in trades, industry, agricultural and technical education in both secondary schools and junior colleges. Curriculum guides have been published for the most prevalent vocational and technical education areas being taught in the secondary schools and junior colleges.

In cooperation with Mississippi State University and the system of junior colleges in the state, the State board has initiated a program of vocational guidance and counseling which is carried on to assist in fitting students into the occupations for which they are best suited. This system extends through the junior colleges to each of the secondary schools in the respective junior college districts.

Industrialists planning to locate a new plant—or expand one already in the state—that need training programs for employment purposes should contact the Director of Vocational and Technical Training, Box 771, State Department of Education, Jackson, Mississippi.

PUBLIC EDUCATION

Mississippi is currently engaged in a re-evaluation and study of its entire public school system with the aim of making it more valuable to the state's quest for economic progress and more useful to all its citizens. Realization of the close correlation between economic strength and growth and an area's educational level prompted this study. An awareness of this correlation is now being felt throughout the public school system of Mississippi: from the secondary schools through the public junior colleges, and into the senior colleges of the state.

An estimated 606,000 students are enrolled in the state's public schools; over 15,000 students are enrolled in the state's junior colleges; approximately 35,000 in

IN MISSISSIPPI

senior colleges; and some 39,000 in vocational and other educational programs provided through the State Department of Education.

The universities and public senior colleges of Mississippi are under the direction of the Board of Trustees, State Institutions of Higher Learning. The universities are: Mississippi State University at Starkville; the University of Mississippi at Oxford; and the University of Southern Mississippi at Hattiesburg.

The public senior colleges of the state are: Alcorn A. & M., Lorman; Delta State, Cleveland; Jackson State, Jackson; Mississippi State College for Women, Columbus; and Mississippi Valley State, Itta Bena.

JUNIOR COLLEGE LEVEL: Electronic Data Processing.

Electronic Shop

Livestock Technical training

Mississippi's public junior colleges are well distributed over the state and thus are physically able to serve the needs of both area industries and local students. Within the junior college districts free bus transportation is furnished for the students. The extra-curricula facilities of the existing junior colleges add a plus-factor for vocational and technical students also.

Four advantages of a junior college education for the students of the state are:

- The high school graduate can find in a two-year college the type of educational program specifically designed to meet his needs whether he plans to continue in a four-year college or to begin his career as a technician or as a craftsman immediately upon completion of his two-year curriculum.
- The junior colleges offer higher education to the student at low cost. Many high school graduates can eliminate the major cost of attending college—the cost of room and board—by attending a college within commuting distance.
- The educational programs of the junior colleges are adapted not only to the needs of high school graduates, but also to the needs of the community and state. As a result, the graduates of these colleges are usually very successful in finding employment.
- Two-year college education aims to provide students with a cultural background sufficiently broad to enable them to take their places in society as responsible productive adults.

Building on the firm foundation of Mississippi's well-established public junior colleges, the new training center concept offers Mississippi students and industry one of the finest and most comprehensive vocational and technical training programs in the nation.

Here sound education and realistic aspirations are firmly welded to form a system that is both practical and profitable.

Students are trained to fill the needs of both existing industry and anticipated

Gas Welding

Licensed Barber School

Auto Body and Fender Repair

industry. Techniques, classroom methods, and equipment are completely modern and employed according to industry standards and specifications.

In addition to established courses, the training centers are geared to work with industry in establishing such new programs and courses as may be required.

Present enrollment in the 10 completed centers approaches 10,000. Some 163 vocational and technical programs in 50 different occupations are being offered.

Particular emphasis has been placed on training industrial technicians—those who operate the key spot between the engineer and the craftsmen. Typical technical training units are operated in all ten (10) training centers in the state. Specialized training is given in the fields of office machines, computers, machinists' work, welding, auto mechanics, radio and television, electricity, refrigeration and woodworking. Specialists are trained in metal cutting, lathe and drill operating, inspecting, welding and mechanics. In addition, special training is given for specific industrial plants. The centers will, on request, send an instructor into a plant to conduct on-the-job courses in special subjects. They also offer special training courses at night.

Industrialists now interested in locating a plant in Mississippi—or expanding one already in the state—can now write their own prescription for a trained labor force and this prescription can be filled by the public junior college training centers.

MISSISSIPPI PUBLIC JUNIOR COLLEGES

Mississippi's 17 public junior colleges are: Northwest Junior College, Senatobia; Coahoma Junior College, Clarksdale; Mississippi Delta Junior College, Moorhead; Hinds Junior College, Raymond; Utica Junior College, Utica; Copiah-Lincoln Junior College, Wesson; Southwest Junior College, Summit; Pearl River Junior College, Poplarville; Northeast Junior College, Booneville; Itawamba Junior College, Fulton; Holmes Junior College, Goodman; East Mississippi Junior College, Scooba; East Central Junior College, Decatur; Meridian Junior College, Meridian; Harris Junior College, Meridian; Jones County Junior College, Ellisville; and Gulf Coast District Junior College, Perkinston. Some of these operate additional branches in localities other than that of their main campus. Vocational and technical training centers are now in operation or are planned for all of these institutions.

In addition to the junior colleges, the University of Mississippi Extension Department, the Industrial Education Department of Mississippi State University, and the Division of Vocational Education of the Mississippi State Department of Education are particularly concerned with the development of appropriate industrial training programs through the public school system of the state.

VOCATIONAL TRAINING IN SECONDARY SCHOOLS

SECONDARY LEVEL: Business and Office Occupational training

STATE DEPARTMENT OF EDUCATION

The Vocational Education Division of the State Department of Education is concerned with vocational training in Mississippi's secondary schools.

The larger high schools in Mississippi have made tremendous progress in establishing more and better vocational trade training programs in recent years. Those trade training programs are designed to serve the following groups of people:

1. In-school youths who have selected a vocation and who need training for entrance into an occupational pursuit;

2. Out-of-school youths who need training and experience, coordinated by public school authorities, to fit them for useful employment;

3. Apprentices and other learners who need instruction related to their trade or occupation to up-grade their skills for occupational advancement.

The major areas of training in secondary schools are described individually below:

Industrial Arts is a segment of public education designed to develop an "industrial consciousness" within the young people. The program is pre-vocational in nature and does not train for any vocation.

The 141 Industrial Arts programs conducted in the state's junior and senior high schools involve a study of the materials, tools, processes and products of industry.

Students explore several fields and phases of industry such as electricity-electronics, drawing and planning, woodworking, metal working, power mechanics, introduction to industrial procedures, problem solving, and personnel management.

Consumer knowledge and industrial safety are integral parts of the training.

Industrial arts education is designed to serve

Electrical Trades classwork

Industrial Arts shop

Vocational Agriculture—FFA winner

four groups: grades 7 and 8—general handicrafts shop; grades 8 and 9—composite general shop; grades 9 and 10—shop work in a major area such as metalwork, woodwork, electricity-electronics, or power mechanics; and grades 11 and 12—mechanical drawing.

Vocational agriculture is taught in 272 high schools, and has been broadened to include instruction in eight skill areas that will aid students who return to the farm, pursue a junior college vocational or technical course or seek immediate employment in industry.

The eight skill areas of each vocational agriculture laboratory are electricity, electric and acetylene welding, concrete and masonry, gas engines and machinery, buildings and structures, plumbing, tool fitting, and metals. A minimum of 20 hours of instruction is given each student in each area which accounts for at least 50 percent of the vocational agriculture instructional program.

Vocational agriculture provides the only skill training available to many rural students. Enrollment is over 13,000.

Adult evening classes are conducted in the eight skill areas as well as in utilization of herbicides and insecticides for weed and insect control, farm equipment repair and maintenance, or any other problem of an agricultural nature.

Most vocational agriculture students gain incentive for excellence through the awards program of the Future Farmers of America organization that encompasses the instructional program.

Distributive education offers students instruction and experience in the distribution and marketing facets of our economy through one of two programs: cooperative, which involves on-the-job training for one-half day throughout the school year, or project study, which deals with problems of business establishments.

Both programs are tied closely with classroom instruction.

Distributive education is committed to training prospective distribution and marketing employees and up-grading adults through evening classes in finance, accounting, personnel relations, marketing, government regulations, legal problems and sales techniques for all types of retail and wholesale businesses.

Leadership Training

Home Economics instruction

Sheet Metal shop

Distributive Education display

Home Economics practical training

Distributive Education, Salesmanship

DECA — the Distributive Education Clubs of America—has an awards program complimentary to the course of study that serves as an incentive to the youngsters.

Health occupations training is offered in any high school where the need is present and a hospital or other appropriate institution can provide the laboratory experience needs of each student.

Educational programs now in operation are hospital housekeeping, nursing unit management assistant, home health aide, dental assistant, operating room assistant, and hospital orderly. Others will be developed as needed.

Home economics are in the 411 high schools. The programs provide educational training for present and future homemakers and for gainful employment in the field of home economics.

Well equipped home economics departments offer instruction in the areas of foods and nutrition, clothing and textiles, management and family economics, child development, housing, and family living. Employment opportunities are available for many of the graduates of this program in work such as altering clothing, serving as dietitian technicians in hospitals and other institutions and in child care nurseries.

Vocational business and office education offers training to the high school graduates who do not enter college but seek employment in some form of office work.

Instruction is in business and office machines, filing, shorthand, typing, bookkeeping and other special problems involved in typical office procedures. This is in addition to the regular accounting and secretarial science courses.

Trade and industrial education is offered in 110 high schools in 46 counties. One or more of the following courses is offered in each school: building trades, auto mechanics, carpentry, welding, sheet metal, radio and television repair, machine shop, metal trades, electrical trades, industrial drafting, power mechanics, electronics, refrigeration and air-conditioning, auto paint and body repair and masonry. Special evening classes have included drafting, commercial art and others.

The 1965-66 enrollment consisted of 4,000 high school students plus 3,000 adults who needed training for a new job

Business and Office Occupations classroom

Machine Shop training

Practical Nurse training

or up-grading in their present employment.

The high school trade and industrial programs have been enriched with new equipment for serving the needs of students. Local trade and industrial coordinators are encouraged to utilize the shop facilities as many hours a day as can be beneficial to their area.

Qualifications for instructors involve academic training and occupational experience. A minimum of a high school education and at least two years work experience above the learner classification in the trade or skill area that is to be taught is required. Most teachers have a total of six years job experience.

These qualifications are to insure that every student can perform the skill according to industrial demands.

This high school program is designed as a two-year course of study for 11th and 12th grade students who are pursuing the normal course of study for a high school diploma. Training is conducted three hours per day with practically all the time involving experiences in the particular skill. Two classes use the facilities each day.

At the end of the two-year program, graduates have a marketable skill. Each graduate should have advanced in his trade capabilities to about the second or third year level of a four-year apprenticeship program.

Should high school graduates choose more training before fulltime employment, they can enter advanced trade training in any one of 17 public junior colleges.

The trade taught in each school is determined by the need in the service area of the school. The need is defined in terms of the employment opportunity survey of the community.

Enrollment is determined by testing, counseling and evaluating the individual in terms of his qualifications for success in the trade being taught.

Trade and industrial programs are operated under the counsel and advice of craft committees. The committee meets at the call of the instructor to see that the course content and physical facilities are in line with the requirements of the trade. The committee keeps the instructor and school officials abreast of current needs and requirements.

MISSISSIPPI'S COMPREHENSIVE TRAINING PROGRAMS ARE

Building on the firm foundation of Mississippi's well-established public junior colleges, the new training center concept offers Mississippi students and industry one of the finest and most comprehensive vocational and technical training programs in the nation.

Here sound education and realistic aspirations are firmly welded to form a system that is both practical and profitable.

Students are trained to fill the needs of both existing industry and anticipated industry. Techniques, classroom methods, and equipment are completely modern and employed according to industry standards and specifications.

VOCATIONAL AND TECHNICAL MEETING INDUSTRIAL NEEDS

In addition to established courses, the training centers are geared to work with industry in establishing such new programs and courses as may be required.

Industry testimonials to the effectiveness of the training offered are common (see section on "Working With Industry"). Employment opportunities abound for the graduate and rising wage rates attest to the continued demand for skilled employees.

Mississippi's public school vocational and technical training system was conceived and put into operation as a useful program to accelerate the state's economic development through sound education; it is accomplishing its purpose. (Read industrialists' statements).

OTHER PROGRAMS

REVOLVING FUND FOR TRAINING

The Industrial Training Revolving Fund Act of 1964 (Chapter 220, HB 79, Mississippi Legislature, Regular Session, 1964) provides for the establishment within the Mississippi Agricultural & Industrial Board a revolving fund for the purposes of industrial plant training and recruitment for new and expanded industries, or both. To this end, the Agricultural & Industrial Board is authorized to promulgate various policies and procedures for the use of these funds.

Section 4 provides that any new or expanded industry may apply for an interest-free loan not to exceed $20,000 for pre-employment or on-the-job plant training. Section 4 (a) provides that the net worth of the industry must meet the prerequisites of the Agricultural & Industrial Board and Section 4 (b) provides that the industry shall submit a detailed plan of its training needs, plans and total amount of funds desired. Section 4 (c) provides that the loan shall not span more than a five-year re-payment plan.

THE MISSISSIPPI EMPLOYMENT SECURITY COMMISSION

The Mississippi Employment Security Commission maintains its administrative office in Jackson. Its statewide operations include eighteen full-functioning center offices, eighteen placement offices, and one youth opportunity center.

In addition to providing job development, placement and testing services for schools and industrialists, the Commission has a dual responsibility with the state's vocational education officials in the development and operation of "The Manpower Development and Training Act of 1962 (MDTA)."

Institutional training under the Manpower Development and Training Act in the State of Mississippi is the joint responsibility of the Mississippi Employment Security Commission and the Vocational Division of the State Department of Education. The vocational training courses operating in the state have been established on the basis of need. The number of students having completed MDTA programs is 1,263. The number of students now in training and those that have been allowed to enter training is 2,770. Currently, institutional training courses are being conducted in thirty-three occupations in twenty-six different areas of the state.

OJT, On-The-Job Training, is the joint responsibility of the Employment Commission, the Bureau of Apprenticeship and Training, and the Vocational Division of the State Department of Education. Following is a list of institutional MDTA courses currently offered in the State of Mississippi.

ADULT BASIC EDUCATION

For Trainees Enrolled in the MDTA Programs

The Mississippi State Department of Education through the Division of Instruction, under provisions contained in The Mississippi State Plan Title II, Part B, of the Economic Opportunity Act of 1964, and in cooperation with the Vocational Division of the State Department of Education, is providing Adult Basic Education for trainees enrolled in the Manpower Development and Training Program operated by the Vocational Division.

The objectives of the pilot project are:

- To utilize the most recent Adult Basic Education materials and methods that can be adopted to upgrade educational deficiencies of trainees enrolled in the Manpower Development and Training Program. This is to include undereducated, unemployed, and underemployed groups.

- To provide classroom procedures that will include the basic skills of reading, writing, speaking, listening, arithmetic, citizenship, health practices, human relations, and job related experiences, grades one through eight (1-8).

- To provide Adult Basic Education, so that trainees may profitably gain from trades instruction in order to reach an entry level in an occupational field.

The Adult Basic Education program is designed to eliminate the inability to read and write English and to substantially raise the educational level of participants with a view to making them less likely to become dependent on others, improving their ability to benefit from Manpower Development and Training occupational instruction and otherwise increasing their opportunities for more productive and profitable employment, and making them better able to meet their adult responsibilities.

INDUSTRIAL EDUCATION AT MISSISSIPPI STATE UNIVERSITY

The Department of Industrial Education at Mississippi State University is dedicated to the industrial development of Mississippi. Purposes supporting this dedication are accomplished through cooperation with the State Department of Vocational and Technical Education, the Mississippi Agricultural and Industrial Board, and other state agencies. Fulfillment of purposes is approached through the following avenues.

The preparation of teachers of technical specialty subjects for junior college technical education programs. A special curriculum is designed to prepare teachers of "technical specialty subjects" in junior college technical education programs. Technical education graduates are qualified to teach or to accept industrial employment in their field of specialty.

The preparation of teachers of trade, industrial, and distributive education subjects for secondary schools. Graduate and undergraduate degrees are offered in each of the above areas. A vast majority of the teachers in these fields in the state have been prepared through this department. Such programs contribute to industrial development by providing a dependable supply of qualified workers on local levels. Industrial Arts courses have as their major objective the development of an industrial consciousness on the part of all young people by acquainting them with industrial methods, materials, and processes.

The preparation of young men for industrial employment on professional levels in the production areas of Mississippi industry. Graduates from the industrial technology curriculum have an excellent background in mathematics, science, and human relations, together with a degree of skill in the use of machines and a knowledge of industrial processes. Such individuals are capable of coping with the technical aspects of industrial supervision and administration, and of dealing successfully with personnel.

A follow-up study of the first 250 graduates in industrial technology revealed that over 50 percent of them are employed in leadership positions in Mississippi industry. The program has gained a strong reputation and is recognized by industrial employers as a source of leadership.

The preparation of curriculum materials and teaching aids for use in trade, industrial, and technical education in secondary schools and junior colleges. The major purpose of the curriculum laboratory is to prepare curriculum materials for use in trade and technical education programs in secondary schools and junior colleges. Consistent with this purpose, a meaningful liaison between education and industry has been established. Through this relationship the training needs of industry are being identified and interpreted in terms of instructional materials for use in vocational-technical education programs.

Principal activities of the laboratory staff are securing, reviewing, and recommending appropriate reference materials; arranging curriculum conferences involving teachers from vocational-technical fields and conferences for the authentication of instructional material, attended by representatives of appropriate industries; and preparing, editing, and publishing curriculum materials.

Curriculum guides have been published for the most prevalent vocational-technical education areas being taught in the secondary schools and junior colleges.

Research and studies which will assist in the accomplishment of the above purposes. Research sponsored by the U.S. Office of Education is under way to ascertain the degree of agreement between electronic content taught in south-eastern post-high school technical education programs and industrial requirements for electronic technicians. It is expected that the results of this study will provide a sound basis for curriculum adjustment to meet changing industrial employment requirements.

Mr. Gene Triggs, Director
Mississippi Agricultural and
Industrial Board
State Office Building
Jackson, Mississippi

Dear Mr. Triggs:

One of the indispensable ingredients for industrial growth is a trained labor force. In fact the well being of existing industry in any area is closely allied to the educational system which feeds manpower into it.

We feel extremely fortunate in Mississippi to have the facilities and programs which exist in our educational system for technical and vocational education. The Mississippi Manufacturers Association has worked closely over the years with the State Department of Education and the Junior College System in developing these facilities and programs. This close cooperation has been in the form of support for appropriations, contributions of actual equipment by some industries, and counsel in making decisions on programs and forecasting needs.

We are proud of the progress to date, but realize we must continue to place more emphasis on recruiting students into vocational and technical career fields. As an organization representing industry in Mississippi, MMA will do everything possible to help anticipate needs and plan for facilities and programs. Our Industrial Training Committee is alert to the needs of manufacturers and is in constant communication with the state agencies responsible for these programs.

Through industry - government cooperation I am certain that Mississippi will continue to grow as an industrial state.

Sincerely,

Joe Simpson

October 20, 1966

For some time now we have been working with the junior colleges in securing qualified applicants for employment. As a result many of our employees are junior college graduates. From talking with these employees and observing their progress on the job, there is little doubt that the time they spent attending the courses at the junior colleges has been rewarded with job success. We have found the junior college graduate to be prepared both technologically and sociologically to meet the demands of modern industry.

Graduates of junior college programs have an improved opportunity to advance themselves in their chosen career field at Vickers. We are looking to the junior college graduate to assume future positions in our management group. This is illustrated by the fact that several of our present supervisors and foremen are graduates of vocational and technical programs of various junior colleges in the State. These employees started out at the bottom in hourly rated jobs and worked their way up to foremen and supervisors in our management group. Certainly the technical training they received at the junior colleges placed them in a position to assume the responsibilities of management.

Sincerely yours,

W. H. Presley, Jr.

October 12, 1966

We have a wonderful working relationship with Northwest Mississippi Junior College in Senatobia, whereby they have agreed to offer any training courses that we desire, providing we have at least ten interested persons to attend. We have utilized this program in the training of welders, brazers, upholsterers, sewers, draftsmen, machinists, supervisory personnel, secretarial procedures, and currently have a group attending tool and die classes. The college has provided a large reservoir of secretaries and other office workers. We believe that Northwest has taken the lead in this cooperative effort to assist industry. We will continue to cooperate in Northwest Junior College's program of area development via the training of workers for industry.

We have positions available that will utilize any graduate of a junior college technical program. We are proud of our relationship and trust that the junior college program will continue to grow and we value the services that Northwest Mississippi Junior College is providing for our area.

Very truly yours,

Max S. Walker

It was thru our original request for help in the Vocational Field that supplied the incentive to further this type of Education at Co-Lin. The tremendous development of this Department at Co-Lin has been most satisfying and exceedingly gratifying in that the State and local area fully recognize this need to develop the full potential of Industry having moved to this area and are contemplating such a move.

We, of this Company, have and are continuing to take full advantage of this training in various fields. Apprentice welders, apprentice machine operators, apprentice tool room machinist are some of the shop training that has been most valuable to our expanded operation. They also have been of tremendous help in Drafting, Machine Shop procedures and at the present time we have a full compliment in the evening classes of Computor Equipment Orientation.

Without question, this type of training has been an invaluable tool in the continued expansion of our operation in Mississippi.

Sincerely yours,

JOHNSTON LAWN MOWER DIVISION

October 24, 1966

For many years our Company has worked closely with the State Department of Education in conducting training programs at Ingalls and in Pascagoula. With the assistance of members of your Trade and Industrial Education Department, many training programs have been successfully operated to the benefit of our Company, its employees, as well as to members of this community and the surrounding communities.

Particularly since 1956, when our nuclear submarine construction program got underway, we have had to continually train and retrain a large portion of our employees. The availability of technical and vocational training facilities in this area has been the foundation on which we were able to fulfill our commitments to the U. S. Navy in producing top quality submarines and surface ships.

In addition to the many welding courses conducted locally by the State Department of Education, more than 300 Ingalls apprentices attend classes at the new Jackson County Junior College and a considerable number of our employees are enrolled in short vocational-technical courses conducted in the evenings by the Gulf Coast Junior College District.

We are gratified by the close cooperation received from State Department of Education personnel and pledge our continued support to your efforts in providing vocational and technical training for the people of Mississippi.

Sincerely,

E. R. Hammett

Senior Vice President

Questions and Answers:

WHAT IS THE CORRELATION BETWEEN EDUCATION AND ECONOMIC GROWTH?

Worldwide examples illustrate the close correlation between education and economic advancement. This is true for areas and individuals. Simply put, an area with educated citizens will advance more rapidly economically than an equal area with less educated citizens. Mississippi is committed to a program of assuring maximum educational opportunities for all of its citizens.

WHAT IS THE INTEREST OF MISSISSIPPI IN VOCATIONAL AND TECHNICAL TRAINING?

Mississippi is now experiencing a period of unequaled industrial growth. Industry demands trained workers and furnishes them with excellent job opportunities. Mississippi believes that it has a duty to its individual and industrial citizens to provide the best possible vocational and technical training to assure and support continued industrial advancement.

WHAT IS THE INTEREST OF INDUSTRIALISTS IN A TRAINED WORK FORCE?

Mississippi industries must meet competitive markets in our state and in other states for quality products. Cost of production is measured by the number of working hours, facilities, equipment, maintenance, raw materials, depreciation, taxes and other related factors. To earn a profit, industrialists must produce quantity and quality products for competitive distribution; therefore a trained and efficient work force is a vital asset.

WHAT ARE THE FUTURE OPPORTUNITIES IN MISSISSIPPI FOR SKILLED CRAFTSMEN AND TECHNICIANS?

From January 1, 1960 to October 1, 1966, Mississippi has secured 530 new industries, 480 new expansions, creating 73,925 new jobs for the state's people. If this acceleration continues for six more years, there will be a need in industry alone for skilled and technical workers of approximately 50,000 additional employees that will pay high wages for those who may qualify.

WHAT ARE THE PRINCIPAL SOURCES FOR FURNISHING 50,000 ADDITIONAL SKILLED AND TECHNICAL WORKERS?

Mississippi's comprehensive vocational and technical schools are now in a position to train at least 10,000 workers suitable for industrial employment each year. Area vocational and technical centers, if the need develops, are in position to step up their programs for at least 15,000 per year.

WHAT IS THE STARTING RATE OF PAY FOR SKILLED AND TECHNICAL WORKERS FOR MISSISSIPPI INDUSTRIES?

Industrial wage surveys indicate a wage scale from $2.00 to $4.00 per hour. Counting fringe benefits, this would include a monthly salary scale from $325 to $500 per month. Experienced craftsmen and technicians' salary scale is from $500 to $800 per month.

WHERE SHOULD AN INDUSTRIALIST—NEEDING A TRAINED WORK FORCE—LOOK FOR COMPETENT WORKERS?

One of the greatest sources for industrial workers can be found in the state's public junior colleges. Especially so, if the workers are required to have special vocational and technical skills.

WHO DETERMINES WHAT TRAINING PROGRAMS ARE NEEDED IN AREA VOCATIONAL AND TECHNICAL TRAINING CENTERS?

Each area vocational and technical training center at the various public junior colleges

Questions and

has an advisory board, made up of agricultural, industrial, and professional leaders. This board consists of from 25 to 50 people interested in agricultural and industrial development. This board works closely with college officials in determining need for training, job opportunities, and placement for trained personnel.

Answers:

CAN MISSISSIPPI'S PUBLIC EDUCATION PROGRAM SUPPLY THE ACCELERATED DEMANDS FOR INDUSTRIAL WORKERS?

Mississippi—during the school year of 1966-67—has 853 accredited elementary schools with an enrollment of 460,263 students; it has 457 accredited secondary schools with an enrollment of 160,557 students; it has 17 accredited public junior colleges with an enrollment of 20,000 students; and it has 16 accredited senior colleges with an enrollment of 30,562 students. This is over and above the various private secondary schools and colleges. Therefore, the potential labor force for industrial development in Mississippi is good.

COOPERATING AGENCIES AND ORGANIZATIONS

Interest in vocational and technical training in Mississippi is at an all-time high and the state's progress in this field is due largely to the work of the leaders serving on the various cooperating agencies and organizations. Some of these are described as following:

William E. Barksdale
Executive Director
Central Mississippi Development District
P. O. Box 1038
Jackson, Mississippi
Tel. 352-5951

Mr. Don Newton, Director

Mr. William B. Barrett
Executive Director
North Mississippi Industrial Development Association
West Point, Mississippi
Tel. 494-4633

Mr. Robert Holyfield, Director
Southeast Mississippi Industrial Development Council
P. O. Box 38
Ellisville, Mississippi
Tel. 477-8617

Mr. Frank Oakes, Executive Director
Southwest Miss. Development District
P. O. Box 686
McComb, Mississippi
Tel. 684-7250

The purposes of developing this vocational and technical handbook are: (1) to provide industrialists with factual information about Mississippi's comprehensive vocational-technical education programs in secondary schools and public junior colleges; and (2) to inform all Mississippians interested in industrial employment where to go to enroll in occupational training programs that will meet their interest, aptitudes and needs.

Much time and thought was given by the Director of the Mississippi A & I Board in selecting a working committee of industrial and professional people to develop this handbook. This committee is to be commended for their efforts. May I say thanks to all members of committee.

Frank Oakes, Chairman

Wisconsin Association of Vocational Agricultural Instructors,

Curriculum Committee

ACKNOWLEDGEMENT

Teachers of Vocational Agriculture in Michigan, in cooperation with several other groups of professional agricultural workers, have completed a large number of community surveys to determine the opportunities in agricultural businesses and services for their students. Dr. O. Donald Meaders, Michigan State University, provided the leadership for many of these studies. Appreciation is extended to Dr. Meaders for permission to use some of the materials developed in those studies.

PREFACE

This booklet is offered only as a guide. It is hoped that each person who uses it will make adaptations to suit local conditions. For example, the types of businesses listed in the tables may not be appropriate for your community.

A GUIDE TO SURVEYING YOUR COMMUNITY FOR YOUTH EMPLOYMENT OPPORTUNITIES IN AGRICULTURAL BUSINESSES AND SERVICES

Why Do A Survey of Your Community?

One of the basic tenets of curriculum offerings of vocational agricultural programs is that the curriculum reflects the needs of the local community. Each and every community is unique. Manpower needs in agriculture are an everchanging quantity with the number of persons employed in production agriculture being less than it has been in the past; and at the same time, the number of persons employed in the business world needing some knowledge of agriculture has increased. Thus, some high schools which offer vocational agriculture are finding it necessary to consider the significance of the latter type of manpower needs in agriculture as they attempt to adjust their programs to changing community needs.

Curriculum changes must begin by gathering a set of facts. Do you know, for instance, the businesses in your community which employ persons who may need agricultural competencies? What agricultural job titles are reflected in these opportunities? What functions does the worker perform? A survey in your community may be needed to obtain facts which answer these and other questions. This set of facts, in addition to contributing the basis for adjustment in curriculum, needs to be used in several other ways. The primary way in which it may be used is to justify curriculum offerings to the students of your school, to your school officials, to the community and to state personnel.

Objectives

It will be necessary to determine a set of objectives for any survey you may intend to conduct. These are listed here as only a sample set, and the questionnaire form in this document was constructed to reflect these objectives. Each community survey will have its own set of objectives which may or may not be the ones reflected here.

1. To locate and identify businesses and services which employ persons who may need agricultural competencies.

2. To determine the functions performed and the extent to which the businesses and services are considered to be agriculturally oriented.

3. To determine the number of persons by job title employed full-time and part-time.

4. To determine annual entry opportunities by job title for employees in these businesses and services.

5. To determine the major functions of each employee.

6. To determine the level of training necessary for entry employment.

Again, these are offered only as possible objectives that you might have for a community survey.

Who Should Do the Study?

The answer to this question will vary with each community. Don't overlook the fact that there may be several agricultural teachers in your area and each of you may be considering a survey. Can you get together and do a combined study? Maybe counties are reasonable things to consider. The best solution may be for all teachers in a county to combine their efforts to complete one major survey thereby avoiding duplication. There are many other professional agricultural workers in the county such as University Extension and Soil Conservation personnel who should be involved in the planning and in conducting of such a survey. Your advisory committee may see this as a function they could perform. Also, one might let this be a learning exercise for students by providing the senior class with the experience of planning, conducting and reporting the survey as a class project to learn about their community. Important points to remember here are: (1) Involvement of a large number of persons--don't try to do the job alone. (2) Do a complete survey insuring that not a single business or service opportunity is overlooked.

What is a Community?

The concept of community has been evolutionary, and at present is rather difficult to define in practical terms due to the mobility of people as well as a breaking down of traditional service areas. Certainly the smallest geographical area one should consider is an entire school district. It is important to cover the area that represents the "agricultural" community, and this is rather difficult to define.

Survey Materials

It is anticipated that for the survey of your community you will need: (1) an interview form, (2) a guide for interviewing, (3) a letter explaining the survey, and (4) tables on which to report the data. Sample copies of these are provided on the next few pages. Remember that these are only suggested and you may feel free to add or delete items to conform to your objectives.

Interview Form: This specific form is designed to meet the objectives listed on page one of this report.

Guide to Interviewing: A guide for the interviews is needed to insure that all interviewers perform in the same manner by asking similar questions. This will help insure valid results.

Letter of Explanation: One should be developed and sent to the prospective firms. Then telephone to make an appointment for the interview.

Reporting

Two items are needed here. These are tables in which to record the data gathered and a discussion of the data. The remaining portion of this leaflet are sample tables which you may find helpful for recording and reporting data. Again, remember these are offered only as suggestions.

INTERVIEW FORM

* Place the appropriate number for the function and the level of training in each column
** Place an asterick by anticipated or future job titles

Interview Guide for
YOUR COMMUNITY STUDY OF AGRI-BUSINESS

1. Before interviewing, make a list of all businesses or firms in the area that are to be interviewed.

2. Select the persons, business or firm, whom you plan to contact for interviewing within a two-week period. Send letter of introduction, then telephone for an interview.

3. Interview the person who has the highest degree of over-all administrative responsibility at the local (county) level.

4. You will in most cases be well known to those you interview. If there is any doubt as to your identity or your official responsibility, be sure to make this known at the beginning of the interview.

5. Preface your interview with a brief review of the purpose of the survey, "to identify present and emerging agricultural occupations, for which vocational and technical agricultural education should be available."

6. Record the official name of the business or firm. Where a firm has no official name other than the name of the owner or operator, record the name of the owner or operator.

7. Record the complete address: number, road or street, and post office.

8. A copy of the interview instrument may be given to the person being interviewed so that he may anticipate the questions, while you are recording answers, and thereby reduce the time required for the interview.

9. Obtain the best estimates possible for question 7.

10. Most of the agricultural jobs have no official job titles. In this case, write down the description of the work done.

11. Make a direct inquiry about anticipated job titles, but don't make up or suggest job titles for the approval of the person interviewed.

12. When the interview is finished, it would be helpful if you would pave the way for a possible cooperative program which might place a student in this business for training. In other words, ask "Would you be willing to work with the school in a training program by hiring a student to work part time while he is still in school and to give him some training in selected jobs?"

13. Express your appreciation for the cooperation on this survey

Other Suggestions:

14. Practice interviewing before making the first contact.
15. Be sure that you are very familiar with the interview schedule.
16. Permit the interviewee to have a blank copy of the interview instrument.

AN OPEN LETTER OF INTRODUCTION AND EXPLANATION TO ALL PERSONS AND FIRMS ENGAGED IN ONE OR MORE TYPES OF AGRICULTURAL BUSINESS IN (YOUR COMMUNITY)

The teachers of vocational agriculture and other professional agricultural personnel are cooperating to conduct a survey which we believe is of great importance to everyone employed in the various segments of our agricultural economy.

This survey will be an effort to identify present and emerging agricultural occupations, for which vocational and technical agricultural education should be available, within our area. It is hoped that we can also determine present and anticipated numbers of employees in these occupations, as well as some of the competencies needed by the employees.

Some time within the next few days a telephone call will be made to your place of business to arrange a brief interview. Since you are a key person with respect to the information needed in this survey, we hope you will be able to give a few minutes of your time to this worthy effort.

For your further information, we are enclosing some background information relating to this survey and its purpose.

Very truly yours,

FOR YOUR INFORMATION

The following background information is presented here so that you may more fully understand why this survey is being made and what use will be made of the data.

The Need for This Study

Developments in technology and automation have caused tremendous changes to take place within our agricultural industry. Significant among these changes is the decrease in the number of persons needed in the production phase of agriculture, accompanied by an increase in the number of persons needed in the off-farm agricultural occupations.

It is generally agreed that there are many opportunities for persons in the non-farm agricultural occupations, but no specific data has been collected in this area on the jobs at various levels. This is partly due to the fact that most of the agricultural service and business job aspects of the agricultural industry have evolved fairly recently. There is some evidence that a number are evolving at the present time.

If our young people are to receive adequate counseling and the educational needs of all our own people are to be met, it becomes imperative that immediate and continuing identification be made of those businesses which embrace jobs requiring some competency in agriculture. With information concerning the number of employment opportunities in these occupations and the nature of the jobs, future needs for educational programs in agriculture may be more accurately projected than is now possible.

Such information is needed in planning more adequate vocational programs for off-farm agricultural occupations in the high schools and post high school institutions in our area. The information will also be valuable to any other local agency or business for planning improvements and expansion of educational programs.

Objectives

1. To identify present and emerging agricultural occupations, for which vocational and technical education in agriculture should be available.

2. To determine present and anticipated numbers of employees in these occupations.

3. To estimate the annual entry opportunities in these occupations.

4. To identify the function of agricultural workers in specific jobs.

TABLE 1

SUMMARY OF EMPLOYMENT DATA BY TYPE OF BUSINESS FOR (YOUR COMMUNITY)

Type of Business	Percent of Business Ag. Oriented	Part-Time	Full-Time	Total	Number of Businesses Interviewed
Agricultural Machinery					
Farm Supply and Service					
Small Animal Farms

APPENDIX A

Here it might be helpful if you could list the names and addresses of those persons interviewed and their comments.

VT 006 799
Hilterbrand, L.R.
Plant Science Information Found in Summaries of Studies in Agricultural Education.

Purdue University, Lafayette, Ind. Dept. of Education
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Nov66 14p.

*BIBLIOGRAPHIES; *PLANT SCIENCE; *AGRICULTURAL EDUCATION; *RESEARCH REVIEWS (PUBLICATIONS); AGRICULTURAL COLLEGES; MASTERS THESES; DOCTORAL THESES

Twenty-nine studies related to plant science, found in "Summaries of Studies in Agricultural Education" from 1956 through 1963, are classified into sub-headings of entomology, farm mechanics, field crop management, forages, forestry, horticulture, plant science, and soil improvement and management. This reference was designed by a subject matter specialist primarily for students pursuing research in agricultural education in colleges and universities. (DM)

99

INTRODUCTION

This bulletin is second in a series to be produced based upon the Summaries of Studies in Agricultural Education. The idea in mind or the original purpose of the bulletin was to produce a more convenient form of reference for researchers in the field of agricultural education. By glancing at the format on page i the researcher can quickly find the topic desired and by turning to the second part of the manuscript the area of interest can be located. The numbers following each statement refers to the bibliography which is arranged in alphabetical order.

It is believed that this criteria can be useful to anyone interested in pursuing some element of research design. However, major emphasis has been put on making information useful and meaningful to the student who wishes to quickly find the studies and content of his interest.

More and more people are accepting the concepts exhibited in plant science relationships. Especially as it relates to the production of food for an increasing world population.

The number of people who remain relatively ignorant of these concepts is large indeed. A very large and significant task before us is the application of science, in this case plant science, to the wise and prudent use of our natural resources.

We hold to the belief that an appreciation of plant science requires an understanding of our natural resources in total. Thus, to the generations yet unborn we should feel an abligation to leave the plants as numerous and undisturbed as we found them. The agriculturist, the forester, the husbandman and others should have a desire to maintain or even improve the vegetation he found growing upon the land. This bulletin, we hope, will aid in an approach to research which will aid in the development of plant concepts and practices.

PLANT SCIENCE INFORMATION FOUND IN

SUMMARIES OF STUDIES IN AGRICULTURAL

EDUCATION

I. Entomology

1. The purpose of the study was to determine the practices used to control insects.
6

2. A questionnaire was used to collect information from farmers.
6

3. Spraying, discing, and plowing was used to control insects.
6

II. Farm Mechanics

1. The purpose of the study was to prepare a maintenance record sheet and construct an analysis sheet for grain drills
11

2. Dealers of farm machinery were interviewed to secure information.
11

3. The study determined that farm equipment needs repair after 5 to 14 years of use.
11

III. Field Crops Management and Test Plot Management

1. The purpose of the study was to determine the quality of the crop produced.
2

2. The purpose of the study was to develop crop improvement and seed certification in Minnesota.
2

3. The purpose of the study was to test teaching aids on small grains.
2

4. Young farmers scored higher in test results than others.
3

5. Crop improvement information was organized into seven teaching units.
3

6. This study found that certified seed was worth more.
3

7. Purpose of the study was also to study problems and agricultural technology in vocational agriculture.
13

8. Texts and periodicals of guidance were analyzed.
13

9. Personal agricultural objectives were found.
13

10. Purpose of the study was to determine the relationship of effect of test plots on planting rate on farms where the test was made.
17

11. Field checks were made.
17

12. The following year after the study was made, the participating farmers increased their plant population per acre.
17

13.. One purpose was to determine principles of agronomy program in six Chio counties.
21

14. The case study approach for agronomy survey was used.
21

15. The purpose of this study was to determine if a teacher could conduct plots of research data and functions for teachers and students of vocational agriculture.
22

16. Correlations between soil test and crop response were used.
22

17. Ninety-nine percent of the farmers indicated teacher-held demonstrations were desired.
22

18. Purpose of the study was to study the use of corn plots.
24

19. Questionnaires were used to secure information about corn fertility practices.
24

20. Most instructors felt that corn fertility plots were practical means of presenting soil fertilizer use information to farmers.
24

21. The purpose of the study was to study the land use of vocational agriculture departments in Oregon.
29

22. The survey method was used on all vocational agriculture land uses; then a checklist was developed from the findings.
29

23. Over one-half of the teachers in Oregon used school owned or operated lands.
29

IV. Forages

1. Forage production in Korea was surveyed.
   1

2. The study found that diet could be increased by supplementing grain with meat and milk.
   1

3. Agriculture in Korea was surveyed.
   1

4. The study indicated that to build up erosion control and provide food for livestock, grassland farming should be expanded.
   1

5. The purpose of the study was to prepare a source unit for vocational agriculture teachers in dairy nutrition.
   10

6. To boost present production farmers should use low cost roughage, thyro protein, and urea.
   10

7. The purpose of this study was to determine the problems in teaching range management in Texas.
   14

8. A questionnaire was used and sent to 94 vocational agriculture instructors.
   14

9. More range management should be taught in high school departments of vocational agriculture.
   14

10. The purpose of this study was to determine the present condition of teaching pasture improvement in Oklahoma.
    15

11. Questionnaires were mailed to teachers and senior students.
    15

12. The study found no relationship between test scores and practices in the study of pasture development.
    15

13. The purpose of this study was to evaluate the method used to determine TDN in forage crops.
    16

14. Forage testing stimulates interest in production of high quality forage.
    16

15. The purpose of this study was to determine pasture management practices.
    23

16. A fifteen random sample was drawn from 2700 farmers.
23

17. Farmers are using more land for pasture than needed.
23

V. Forestry

1. The purpose of this study was to determine the need for teaching farm forestry.
5

2. Data were collected by means of a questionnaire supplied to teachers of vocational agriculture.
5

3. Forestry should be taught to high school students with one-half time devoted to field work.
5

4. The purpose of the study was to determine the educational needs of wood products employees.
12

5. Fifty-three industries in 14 counties were interviewed.
12

6. Most teachers believed that conservation and forestry should be taught to students of vocational agriculture.
12

7. The purpose of the study was to determine the importance of forestry, general agriculture, and conservation in vocational agriculture as compared to the present program being offered.
18

8. Comparisons were made between the number of practices taught and recommended and the levels of learning recommended and the levels taught.
18

9. An enormous gap between what expert opinion recommended to be taught and what was being taught to adults and high school students.
18

10. The purpose of the study was to determine what has been done in teaching conservation of natural resources.
25

11. A survey was made of conservation education in public schools
25

12. Most colleges and universities are doing nothing to train teachers in conservation and have no plans to do so.
25

VI. Horticulture

1. The purpose of the study was to measure three kinds of planting learning principles relative to light, temperature, moisture, aeration, and nutrients.
7

2. The teaching method used in this study was laboratory manual, functional experience, and the teacher's own method.
7

3. Students who had access to greenhouse facilities scored higher than students using facilities for growing crops.
7

4. The purpose of the study was to study the relationship between test scores and yields in potato production.
9

5. The mean yield of students was higher than the state average.
9

6. The high yield and use of practices may indicate that the fields studied may have represented only the upper portion of the total sampling distribution.
9

7. The purpose of the study was to construct a calendar of activities and test the effectiveness with first year students.
19

8. Teachers found that inadequate physical facilities are the most difficult problem to overcome in the operation of the school.
19

9. Most of the greenhouses are operated only in the spring months and the teachers do not have an organized program of work.
19

10. The purpose of this study was to determine the practices used in peanut production.
20

11. The producers who used crop rotation, commonly planted oats and vetch in the fall.
20

12. Recommendations for increasing yields included crop rotations, fall fertilizer applications and use of fertilizer in the spring at planting time as well as side dress.
20

13. The purpose of the study was to make an analysis of current mushroom production, verify results and prepare teaching aids.
27

14. Information was collected by interviewing mushroom growers.
27

15. The problems of mushroom production were identified and detailed instructions in the carrying out of each practice enumerated.
27

16. The purpose of this study was to gather information about the nursery industry.
28

17. Information was gathered by personal interviews with 286 nursery operators.
28

18. The findings indicated that programs are needed at both the secondary and collegiate level to prepare employees for the industry.
28

VII. Plant Science

1. The purpose of this study was to develop principles basic to teaching the fundamentals of plant science.
8

2. A committee of subject matter specialists assisted the investigators in developing and authenticating principles of plant science.
8

3. It was concluded that students benefited when subject matter specialists synthesized subject matter into basic, related principles.
8

VIII. Soil Inprovement and Management

1. The purpose of the study was to ascertain instruction in soil fertility practices, identify instruction, and obtain recommendations from teachers for improving instruction.
   4
2. Teachers were interviewed and others consulted to determine subject matter content of fertilizers used.
   4
3. The students enumerated that teaching of students was for understanding and information, while teaching adults was for adoption of practices.
   4

4. The purpose of the study was to determine how pH and water-holding capacities might differ between high clay content soils and those composed of whole shale and silt and relate this information to basic principles that should be taught.
   26

5. Three soil types were found to have a high water-holding capacity (pH of all soils over 6)
   26

6. The study indicated the needs for intensive, basic instruction in soil characteristics.

School to Employment Program (STEP); A Manual of Information and Instruction for Preparing an Application for a STEP Program.

New York State Dept. of Education, Albany. Div. of Pupil Personnel Services

MF AVAILABLE IN VT-ERIC SET.
Pub Date - Apr 68 37p.

VOCATIONAL EDUCATION; STUDENT EMPLOYMENT; *GUIDELINES; *DROPOUT PREVENTION; *WORK STUDY PROGRAMS; DROPOUT PROGRAMS; HIGH SCHOOLS; HIGH SCHOOL STUDENTS; *STATE STANDARDS; STATE PROGRAMS; PROGRAM GUIDES; *PROGRAM PROPOSALS; PROGRAM ADMINISTRATION
NEW YORK; *SCHOOL TO EMPLOYMENT PROGRAM; STEP

Designed for school districts wishing to apply for matching state aid in support of a School to Employment Program (STEP), school districts may also use this guide in developing a program to meet the educational needs of a significant segment of the pupil population. Content includes regulations of STEP and general guidelines and procedures in applying for state aid. Information is included concerning: STEP program objectives, procedure for student selection, curriculum, work experience, instructional and pupil personnel services, physical facilities, orientation, parents, advisory committee, and evaluation and followup. Supplementary material includes an application form, a sample proposal, a special program budget, an annual progress report, and a sample registration card. (DM)

FOREWORD

In seven years, STEP, the School-to-Employment Program, has served over 7,000 pupils in 40 school districts. It has demonstrated a very effective way of changing many likely unemployed school dropouts into successful students and productive workers.

This manual combines program and application directions and a reporting outline. It is intended as a guide for those school districts wishing to apply for matching State aid in support of a STEP project.

There is no reason, however, that the manual should not have much wider use. The Regulations concerning STEP provide that, "The Board of Education of any school district may, with the approval of the Commissioner of Education, establish school-to employment programs for students who have been identified as potential school dropouts." Many school districts will find in a STEP type offering, a program which can be very effective in meeting the educational needs of a significant segment of the pupil population.

P B Dungworthy

Assistant Commissioner for
Pupil Personnel Services
and Continuing Education

S C H O O L T O E M P L O Y M E N T P R O G R A M

(STEP)

STEP was conceived by representatives of the New York State Education Department, the New York State Division for Youth and the Governor's Office as a possible solution to the problem of widespread unemployment among school dropouts. STEP is coordinated by the Division of Pupil Personnel Services of the State Education Department.

The goal of the program is the reduction of the number of unemployed school dropouts. STEP, a work study program for potential school dropouts 15 years of age and older, is designed to enable these students to eventually return to the normal school program and graduate, or to obtain satisfactory full-time employment if they should leave school. The program combines work experiences and daily orientation sessions under the supervision of a teacher-coordinator. It is expected that the opportunity to become familiar with the demands of the working world and to explore the appropriate adjustments to these demands under the supervision of a trained teacher-coordinator will develop in these students those habits, attitudes, and skills necessary for success in school and on the job.

STEP students most often attend school in the morning and are employed in the afternoon. In addition to the required daily orientation class, pupils attend other classes appropriate to their ability and needs in the regular school curriculum in the morning hours.

At times, because of the difficulty in obtaining private work experience placements for potential school dropouts, students are placed in tax supported agencies, e.g. the school system itself where stipends are paid from State aided school district funds. Work for private employers is not so reimbursed, but is paid for by the private employer. STEP students are not employed except in accordance with the New York State Labor Law.

The 1962 Legislature amended the Education Law (Article 93, Section 4608) to permit school districts to establish school to employment programs. The amendment was subsequently approved by the Governor. In January of 1963, the Regulations of the Commissioner of Education governing STEP were approved by the Board of Regents (Article 25, Section 191).

SCHOOL TO EMPLOYMENT PROGRAM

Regulations of the Commissioner of Education
Article 25, Section 191

I. Establishment

The Board of Education of any school district may, with the approval of the Commissioner of Education, establish school to employment programs for students who have been identified as potential school dropouts. Such programs shall be a part-time school, part-time employment nature.

II. Purpose

The purpose of such a program shall be the assistance of students in improving their capacity to perform successfully as full-time employees, if they leave school, or as full-time students if they elect to return to the normal school program.

III. Nature of Required Study Program

A. Students shall meet at least one period each school day with a qualified instructor to consider topics designed to facilitate adjustment to school and employment.

B. For the remainder of the school day, students shall be enrolled in those classes of academic, special and vocational instruction appropriate to their individual needs, interests and abilities.

C. Necessary and proper counseling services, psychological services, remedial services and other school services necessary to the progress of the individual student, shall be provided by the participating school district.

IV. Nature of Required Work Program

A. Such program shall be in the nature of part-time employment.

B. Such program shall provide for (1) a maximum of three hours of participation in the work program per day or twenty-three hours per week that school is in session, in the case of those participating students fifteen years of age, (2) a maximum of four hours of participation in the work program per day or twenty-eight hours per week that school is in session, in the case of those participating students sixteen years of age or older.

C. Students shall be placed either with public agencies, or with private employers in accordance with the Education Law and the provisions of these regulations.

1. Students shall not be placed in employment situations unless covered with a policy of Workmen's Compensation Insurance.

2. Students shall be placed only with employers who provide the necessary supervision of the students and who provide working conditions conducive to the success of the program, to be determined by the school district, with the approval of the Commissioner of Education.

   a. All participating students must obtain employment certificates.

   b. No participating student under the age of sixteen years shall be placed in an employment situation in a factory room.

   c. All places in which students participating in such a program are placed in an employment situation shall be so constructed, equipped, arranged, operated and conducted so as to provide reasonable and adequate protection to the lives, health and safety of all such participating students. It shall be determined by the participating school district, subject to the approval of the Commissioner of Education, that such places meet said qualifications herein.

V. Student Qualifications

A. Students in the program shall be at least fifteen years of age.

B. Students in the program must have been identified as potential school dropouts.

VI. Teacher-Coordinator

A. The school district shall assign a licensed teacher, properly qualified, to instruct the students in the program so as to assist their orientation to school and employment, to supervise their school and work experience, to promote their progress within the program and to coordinate the total program.

VII. Advisory Council

A. The school district shall establish an Advisory Council composed of qualified representatives of groups such as labor, business, industry, boards of education, civil service commissions, city and county governments, social agencies, state agencies, and service clubs.

B. Such Council shall serve for the purpose of guiding and advising the school district in the development of its program and in evaluating its progress.

GENERAL GUIDELINES FOR STEP PROGRAMS

The following outline indicates how STEP projects are typically conducted in New York State by districts in accordance with State legislation and Department policies.

I. The STEP Program Objectives

A. To reduce the number of unemployed school dropouts.

B. To provide potential dropouts, students 15 years of age and older, with educational and work experiences that will enable them to succeed in full-time employment if they leave school before graduation.

C. To encourage pupils who choose not to leave school, to return full-time to a school program leading to a high school diploma.

D. To give these students a more realistic concept of the world of work and their responsibilities as employees.

E. To give these pupils insights concerning the importance of education for occupational success.

F. To bring about significant changes in the attitude, the outlook, and the general behavior of these students, as well as greater insight into problems they may be experiencing.

II. Selection of Students

A. Only students 15 years of age and older can enter the program.

B. Students are to be systematically identified as potential dropouts. Factors usually associated with early school leaving such as school failures, truancies, behavioral and attitudinal problems help to identify these students. See Pupil Holding Power Data Sheet (Appendix 1).

C. Interviews are to be conducted with prospective STEP candidates and their parents to explain the program.

D. Written consent of both parent and student are required in order to enter the program.

E. Final selection of students should be made by a committee. A typical committee might consist of the teacher-coordinator and representatives from administration, pupil personnel services and instructional services.

F. Suggested Initial Screening for STEP Class

1. Staff members of the school in which STEP unit is to be established should submit the names of students they feel can profit from the program.

2. The teacher-coordinator with the help of staff members should complete the rating scale, Pupil Holding Power Data Sheet (Appendix 1) for the students nominated for STEP.

3. Following a tabulation of the number of vulnerable checks for each STEP nominee, a list of potential STEP students should be drawn up.

G. Selection of STEP Class

1. Before the final selection is made, information approaching that required for a case study should be gathered concerning each student. This information will have value not only in the selection process but also in devising the schedule of instruction and work experience for program participants. The final selection of STEP participants should be made by the committee referred to above.

2. The pupils selected and their parents should then be contacted by the teacher-coordinator so that they may become familiar with the purposes and procedures of STEP. This may be accomplished during the summer months by the teacher-coordinator. The reactions of the student and his parents to the program should become an important factor in the final decision concerning STEP program participation.

3. A STEP registration card should be completed for each pupil enrolled in the program.

4. A program with a full-time teacher-coordinator can enroll 25 pupils; with a half-time teacher-coordinator 12 pupils.

III. Curriculum

A. At least one period a day must be designated for an orientation session for which one unit of school credit toward graduation may be granted. Topics generally covered in this daily orientation session are concerned with getting and holding a job, developing effective work habits and other related areas. (See Developing Work-Study Programs for Potential Dropouts - A Manual)

B. Instruction, other than the STEP orientation class generally involves about 3 periods of regular classroom work. Subjects taken by each STEP student should be consistent with his abilities and interests.

C. For regular classroom work, it is strongly advised that STEP students should be placed with teachers who have had experience, good relationships, and success with potential dropouts.

IV. Work Experience

A. Students are required to obtain necessary working papers.

B. Selected students spend 3 to 4 periods a day on the job for which credit toward graduation can be granted. Emphasis here is not upon the learning of a specific vocational skill, but rather upon the performance of a useful task in a realistic job situation.

C. Work experiences should be in private employment situations, if available, or in public agencies, such as schools, city departments, hospitals, public libraries, welfare offices, etc., if private employment situations are not available or appropriate.

D. Work stations must meet the requirements of the New York State Labor Laws.

E. For work in private employment, wages are to be paid by the employer. For work in public agencies, stipends are paid by the school. Students may receive stipends from 70¢ an hour to $1.00 an hour on a graduated scale.

F. The STEP coordinator is responsible for the supervision of STEP students and for liaison with employers.

G. State regulations permit a maximum of 3 hours a day on the job during the period that school is in session for those 15 years of age. A maximum of 4 hours a day is permitted for those 16 and over. In addition, students may work 8 hours on Saturday.

H. Students are not placed in employment situations unless they are covered by Workmen's Compensation.

I. A student is expected to follow the usual application and interview procedures required of the regular employees in the agency in which he seeks to be placed.

J. The school is to be kept informed of the student's work progress, attendance, and changes in the student's work status.

K. Each school should establish a policy regarding attendance at work on a day when the STEP student is absent from classes. STEP students and work supervisors should be informed of this policy.

V. Teacher-Coordinator

A. The teacher-coordinator is the key to success in the program. He is not just another teacher assigned to another class, but he is a teacher with special duties and extensive responsibilities. He is a work supervisor, a teacher and a guide concerned with the activities of the STEP pupils in school and at work. Sufficient time must be allotted in his daily program to allow for this.

B. The teacher-coordinator participates in the selection of students, conducts a daily class with these students, visits employers and supervisors, interviews students and parents, follows up on student's progress with subject teachers, and maintains the necessary records.

C. The teacher-coordinator should be a person with whom the students can establish a relationship of trust, respect, and confidence. He should be one who understands their problems, and with whom they can relate and communicate freely. He should be able to establish effective rapport so that students may receive advice and sympathetic understanding from him.

D. In a half-time program the teacher-coordinator may teach up to three periods of academic work plus the STEP orientation class, leaving approximately one-half of the day for other STEP duties.

VI. Instructional and Pupil Personnel Services

A. Instructional, remedial and pupil personnel services necessary for the progress of the individual student should be provided by the school district.

B. When extra instructional, remedial or pupil personnel services are formally scheduled as part of the STEP program, additional personnel may need to be added.

C. Case conferences provide an effective means of bringing together pertinent information about individual pupils and their progress.

VII. Physical Facilities

A. The STEP program teacher-coordinator should have available an office which affords privacy when conferring with students, teachers, and parents.

B. A telephone to enable the teacher-coordinator to keep in contact with employers and parents should be provided.

C. The STEP program orientation class should meet in a classroom where it is possible to display materials relative to the objectives of the STEP program.

VIII. Orientation

A. Orientation to the STEP program, its objectives and procedures, should be provided for the school staff.

B. Provision should be made for reports of progress of STEP students, both to and from the staff.

C. Inservice programs for the school staff have been found valuable in increasing the understanding and acceptance of potential dropouts.

IX. Parents

A. STEP, a voluntary program, requires the consent of the parent before a pupil may participate.

B. Effective communication with parents should be established and maintained. Home visits, scheduled evening or late afternoon office hours, and group meetings may be used.

C. Group meetings for parents have been found to be helpful in aiding parents to assume their responsibilities for their son's or daughter's progress in the STEP program.

X. Advisory Committee

A. An advisory committee can help the school district in the development of the program and in the evaluation of its results.

B. Such a committee should be composed of representatives from labor, business, industry, boards of education, civil service commissions, city and county governments, social agencies, state agencies, and service clubs.

C. The advisory committee should hold regularly scheduled meetings.

D. The teacher-coordinator should report to the advisory committee on the development and progress of the program.

XI. Evaluation and Follow-up

A. In order to evaluate the student's progress during STEP, the status of the student in various areas must be determined at the time of entry into the program, e.g. attendance records for the prior year, grades for the prior year. These, then, can be compared to the student's status at the end of the year, e.g. attendance during the STEP program year, grades during STEP program.

B. A plan should also be established for periodic follow-up of all STEP students. Some districts may want to establish control groups to evaluate the local effectiveness of the STEP program.

APPLICATION FOR STATE AID FOR A SCHOOL TO EMPLOYMENT PROGRAM

The State Education Law provides for State aid for school districts which establish part-time school and part-time employment programs for potential school dropouts within the framework of the regulations adopted by the Commissioner concerning such programs.

School districts wishing to receive aid for efforts in this area must submit applications in accordance with the instructions in this manual. Members of the Division of Pupil Personnel Services may be consulted on matters of program organization before an application is submitted. Please call Area Code 518 - 474-3980 or 518 - 474-3520.

I. Filing of Applications

Applications are due May 1st prior to the fall a program is proposed. Early submission of an application is advisable to permit adequate evaluation and the negotiation of changes in the proposal. Occasionally, it has been possible for the Department of Education to approve proposals submitted during the year for immediate establishment should the district request it and State funds and matching local funds are available.

II. Calculation and Payment of Aid

The amount of aid is determined by the excess costs of the program. Excess costs are defined as those over and above expenditures for the district's normal, regular educational program. The State will reimburse districts for one-half of the approved excess costs.

State aid payments for school to employment programs will be made in two installments; approximately 50 percent of the State's share of anticipated expenditures will be paid early in the school year. The balance will be paid after the annual progress report and the accounting of the actual approved expenditures are received. These reports will be due no later than July 15.

The final payment will be determined as follows:

Approved Expenditures X .50 = Total State Aid
Total State Aid - First Payment = Final Payment

III. Continuation of Support

Approval of a school to employment program for State aid is awarded on an annual basis. Payment of aid in one year neither guarantees or prejudices the continuation of aid in subsequent years. Schools are normally funded on a 50% basis for 5 years. After that time, the school supports the STEP program in line with the Commissioner's Regulations with its own funds.

A student normally remains in the STEP program for one year. However, a student may be continued in the program if it is felt that this would be in his best interest.

IV. Publications of Findings

From time to time, the State Education Department may release brief descriptions of school to employment programs supported by State funds. However, the publication of results is the privilege of the sponsoring school district. The Department expects that all publications based on State-aided projects shall include an appropriate reference to the support given by the State Education Department. This may be done in a footnote to the title reading "The work upon which this report was based was supported jointly by the (name of school district) and the New York State Education Department under Article 93, Section 4608 of the State Education Law." At least 10 copies of such publications shall be furnished to the Department without charge.

V. Copyrights

Any material developed with State monies are the indisputable property of the State of New York. Therefore, any copyrights of materials produced in connection with a State-aided school to employment program must be issued in the name of the State of New York.

Special arrangements may be made for the publication of materials by the persons developing them. Prior authorization for publications must be obtained through the Division of Pupil Personnel Services, and ten copies should be furnished the Department as indicated above.

VI. STEP Transportation

Transportation, except for field trips, is not normally a State-aidable item from Special Program funds. However, if a district has a special case involving transportation of STEP students to work stations where such transportation is not eligible under the district's regular transportation aid, the costs may be considered for Special Program aid.

Such cases will be considered and treated as individual cases on their own merits and within the limits of the appropriation and the availability of funds for this program.

Transportation aided under any Special or Experimental Program is not eligible for regular transportation aid.

All transportation of pupils by a district must comply with all laws, regulations, rules, governing transportation of students by a district.

For information regarding the handling of the district's transportation accounts, contact the Division of Educational Management Services.

VII. Screening of Applications

Applications will be screened by a departmental committee as they are received. At the close of the application period they will be ranked according to educational value and merit. The criteria for evaluation are detailed in Section VIII.

The eligibility of a school district for State aid will be determined by the position of its proposal on the ranked list. The law provides that State aid payments shall be made according to this list. Because of limited funds it is probable that not all proposed projects can be supported. The pursuit of worthwhile projects, however, is encouraged even if fiscal aid is not available.

VIII. Criteria for the Evaluation of a Proposed School to Employment Program

A. Significance

1. The proposal offers promise of significantly reducing the number of unemployed school dropouts within the area served by the school district.

2. The proposal is so designed that it may be readily adopted with profit by other interested school districts.

B. Program Design

1. The proposal reflects understanding of STEP law, Commissioner's regulations and guidelines concerning STEP.

2. The procedures to be followed are presented in sufficient detail to demonstrate their contribution to the program's objectives.

C. Operational Promise

1. The school district making the proposal has adequate facilities for carrying it out.

2. The teacher-coordinator assigned to the local project possesses characteristics, training and experience which is related to the needs of a part-time school, part-time employment program for potential school dropouts.

D. Economic Efficiency

1. The program calls for specific expenditures over and above those the district would normally assign to such a purpose.

2. The anticipated expenditures are justified by the procedures to be followed.

3. There is a reasonable relationship between the value of the expected results and the total excess expenditures.

IX. Preparation of a Proposal

A. A proposal for state aid for School to Employment Programs should be typed on 8½" x 11" paper in accordance with the outline in this manual. All pages should be numbered and securely stapled or otherwise bound together.

B. Three copies of the proposal are required. These may be prepared by any duplicating method producing legible copy. Three copies are needed to facilitate review by members of the Division of Pupil Personnel Services.

C. The original signature of the superintendent or supervising principal should appear on at least one copy of the application.

D. Complete the cover page for your proposal as illustrated on p.13. Develop each of the items referred to in the sample proposal, identifying them by the number and the underlined word or phrase.

E. The proposal should be succinct, but sufficiently descriptive to give a clear picture of the work to be undertaken.

F. Proposals should be mailed to:

The School to Employment Program
Division of Pupil Personnel Services
N.Y. State Education Department
Albany, New York 12224

G. Final date for receiving proposals for 1968-69 is May 1.

(Sample cover page for a STEP Proposal)

APPLICATION TO THE COMMISSIONER OF EDUCATION FOR STATE AID FOR A SCHOOL TO EMPLOYMENT PROGRAM FOR POTENTIAL SCHOOL DROPOUTS SUBMITTED UNDER THE PROVISION OF ARTICLE 93, SECTION 4608, OF THE STATE EDUCATION LAW

Proposed number of students to be involved in the STEP program by grade level:

Boys: 7th__, 8th__, 9th__, 10th__, 11th__, 12th__, Total_____

Girls: 7th__, 8th__, 9th__, 10th__, 11th__, 12th__, Total_____

Total_____

1 The popular name of the district will be used for general reference to the project.
2 The assigned administrator is the person who will direct the operation of the local program
3 The teacher-coordinator is the person who will actually conduct the program for students.

Sample Outline of a Proposal

Title of Project

I. The Problem

Write a brief statement of the problem and the factors that contribute to this problem. Refer to the incidence of "dropping out" in your district and the implications for the students and the district. Explain briefly how a solution to this problem will be approached through the use of a School to Employment Program.

II. Objectives of your District's Proposal

Give the objectives of the local STEP program. Are these objectives, so stated, that progress toward them can be measured or observed?

III. Selection

How will screening and selection of STEP students be accomplished? Who will select the students? How many students will be served in the program? Will both boys and girls enter the program? How will the students and parents be informed of the program?

IV. Curriculum

How often will the students meet with the teacher-coordinator as a group? What will be the content of the group meetings?

Will students in the program be assigned to subjects in the regular classes in the school program? If so, by whom? Will students be assigned to other than regular classes and the orientation class? Explain.

V. Work Experience

How many hours per day and per week will these students be employed? Will work stations in both public and private agencies and establishments be used? What types of situations will be provided in public and private agencies? Is there to be any sequence for public and private employment?

Will students apply for work situations and be interviewed as are all other employees? At what rate will students be compensated for work experience in public agencies? (In private employment, they must receive the State minimum wage.)

VI. Teacher-Coordinator

Indicate the teaching license held by the teacher-coordinator. What qualifications, characteristics, and experience does the STEP coordinator possess for this position? For how many periods per day will the STEP coordinator be assigned to STEP activities? What assignments other than STEP will the teacher-coordinator have?

VII. Instructional and Pupil Personnel Services

How will guidance, psychological, social work, attendance, health, remedial and other school services be provided for STEP students? Will there be any increase in the amount and kind of these services offered to STEP students because of their membership in the program? If the district undertakes to improve the basic skills of these students, how will this be accomplished and who will be responsible for such instruction?

VIII. Physical Facilities

Describe the physical facilities the teacher-coordinator will have available for his use. What kind of office facilities will be provided for the teacher-coordinator's use? What classroom facilities will be provided for the teacher-coordinator's use? Will any special facilities be made available for the teacher-coordinator's use?

IX. Orientation and Inservice Training

What orientation procedures will be used to acquaint the school staff with the objectives and planned activities of the STEP program? Will inservice training be provided for the school staff who will work with the STEP students? Explain.

X. Parents

How will parents be acquainted with the objectives and planned procedures of the STEP program? How will they be kept informed of the progress of their son or daughter?

IX. Advisory Council

What local organizations will be represented on the council? How often will the council meet? What contribution will the council be expected to make to the development of the program?

XII. Evaluation and Follow-Up

At least one annual report concerning the progress of local programs will be required. (See Annual Progress Report.) What data will be gathered to determine the effectiveness of the STEP program? How will the stated objectives of the local

program have been accomplished? Explain procedures for following up students after they have left the program. At what intervals will students be followed up? Will a control group be selected for comparison purposes?

Budget Preparation:

Give the total estimated costs of the program for the school year. This figure should represent total anticipated cash expenditures for the functions covered by the program. The budget is to be detailed in the concluding section of the application on forms as provided. The form may be duplicated; care should be taken to begin and end pages as they are shown.

Expenditures other than those specifically mentioned in the budget will not normally be approved for State aid purposes. All estimated cash expenditures must be directly related to the program and to be approved must be "excess costs."

In the event that application is being or will be made to Federal, other State Special Aid Programs, or private sources, such should be indicated and the amount to be received noted.

In the case of Federal and/or other State Special Aid Program monies, such may be deducted before allowable expenditures for State aid for this program are determined, either for purposes of first or final payment as the case may be. Monies received from non-public, private grant sources will be considered as district monies. However, the total of Federal, State and/or private grant monies may not exceed the total budget; if such is the case, State monies will be reduced first.

The excess costs of the program should be entered on the budget form as follows:

100 Personal Services:

Enter here the information requested only for salaries of district employees on which fringe benefits are paid.

Enter under 611, 613, 615, 616, the appropriate amount as a sub-total.

Use the following rates to determine retirement budgetary estimates:

611 - Teachers Retirement - 19.0936 (includes supplemental payment)

613 - Employees Retirement - on 5% Take Home Pay - 12.365
on 8% Take Home Pay - 14.765
Non-contributing Pay 15.837

These are firm rates and will be used to determine final reimbursement regardless of changes in the rate at a subsequent time.

200 Equipment:

If items of equipment have not been selected at this time, a lump sum not to be exceeded may be entered and noted as follows: "To be selected under guidance of the Division of Pupil Personnel Services, New York State Education Department."

300 Supplies and Materials:

As for 200 Equipment.

400 Other Expenses:

Allowable expenditures not fitting elsewhere are to be included here such as personal services not subject to fringe benefits, etc.

The above totals are to be entered on the Summary Page & Estimated State aid will be established. Approximately one-half of the Estimated State aid will be made in the first payment.

Project STEP

Directions

1. In order to obtain comparable information from all districts participating in Project STEP so that a more fully representative picture of Project STEP developments on a Statewide basis can be provided, we ask your cooperation in reporting on all items included in this form. If you do not have the information requested on a particular item, note "not available" in the space provided.

2. Please include at the end of this progress report a one-page case summary of a STEP pupil who was enrolled in the project in the last 12 months for each participating school in the district (i.e. two schools in your project -- two case summaries).

3. All other relevant and supporting materials -- such as newspaper articles, photographs, quantitative data, case studies and comments -- which you care to submit will be most welcome; these should be included in an Appendix.

I. Pupil Data

A. What was the number of pupils who were enrolled in the STEP program as of September 18, 1967? A._____

B. How many of the above pupils completed the year enrolled in the STEP program? B._____

C. What was the number of pupils who were enrolled in the STEP program after September 18, 1967? C._____

D. How many of the above late entrants completed the year enrolled in the STEP program? D._____

E. Total enrollment (A + C) E._____

F. Pupils completing year enrolled in STEP (B + D) F._____

G. Number of pupils who left the STEP program during the school year (total enrollment minus pupils completing year) G._____

H. Classify each of the pupils who left the STEP program during the school year (Section I, G) under one of the following categories:

1. Returned to regular school program _____

2. Left school with assurance of employment _____

3. Left school <u>without</u> assurance of employment _____

4. Left school and entered Armed Forces _____

5. _____ _____
Other, specify

6. _____ _____
Other, specify

7. _____ _____
Other, specify

(This total should be equal to Section I, G) Total _____

I. Summarize the plans for 1968-69 as expressed by pupils enrolled in the STEP program at the end of the current school year:

1. Number planning to return to regular school program _____

2. Number planning to enter another work-study program _____

3. Number planning to re-enroll in the STEP program _____

4. Number planning to enter Armed Forces _____

5. Number planning to leave school with assurance of employment _____

6. Number planning to leave school without assurance of employment _____

7. _____ _____
Other, specify

8. _____ _____
Other, specify

9. _____ _____
Other, specify

10. _____ _____
Other, specify

(This total should be equal to Section I, F) Total _____

J. In your opinion, are the above students' plans generally realistic?

K. What difficulty, if any, do you anticipate the students will have in carrying out these plans?

II. Curriculum

A. List the general topics covered in the daily STEP orientation class.

B. What materials, such as booklets, workbooks, filmstrips, films, or classroom activities were found to be exceptionally effective and might be recommended to other coordinators?

C. List all places to which field trips were taken. What was the general reaction of the students to these trips? How did these field trips contribute to meeting the objectives of the STEP program?

D. Who had responsibility for assigning students to classes in the regular program?

E. Were teachers who have had experience and success in working with potential dropouts utilized when placing students in the regular program classes? Yes____ No____ Sometimes____

F. If answer is no or sometimes, indicate reasons why.

III. Work Experience

List the student's name, job title and total amount of money earned for the school year as a result of STEP program participation. Students changing jobs should be entered in more than one section. (Attach additional sheets as needed for listing students.)

A. Boys - Private employment

Name	Job Title	Approximate Amount Earned

B. Boys - Public employment

Name	Job Title	Approximate Amount Earned

C. Girls - Private employment

Name	Job Title	Approximate Amount Earned

D. Girls - Public employment

Name	Job Title	Approximate Amount Earned

E. How often is each pupil rated by his employer for STEP work experience? (Please attach a copy of the rating form if used.)

F. What criteria were used to judge the acceptability of a work station?

G. On the average, how often during a month was each work station visited by the teacher-coordinator?

H. What procedures were used by the students in applying for positions in private employment?

I. What procedures were used by the students in applying for positions in public employment?

IV. Teacher-Coordinator

A. List the name of the teacher-coordinator and the area in which he holds certification:

_____ _____
Name Certification

B. How many periods per week is the teacher-coordinator assigned to STEP? _____

C. What school assignments, other than STEP, does the teacher-coordinator have?

D. How many periods per week does the teacher-coordinator devote to these other duties? _____

E. Number of periods per school week: _____

V. Instructional and Pupil Personnel Services

A. List the periods per week the following staff members are specifically assigned to the STEP program:

Position	Periods per week
Teacher	_____
Attendance Teacher	_____
Counselor	_____
School Psychologist	_____
School Social Worker	_____
School Nurse-Teacher	_____
Remedial Reading Teacher	_____
Tutors	_____
_____	_____
Other	

B. Describe the manner in which educational specialists not specifically assigned to STEP assisted STEP students and the number of students who received service from each specialist. If the following staff members are not regularly available at your school, write does not apply.

1. School Psychologist. Number receiving aid from psychologist_____

2. Guidance Counselor. Number receiving aid from guidance counselor_____

3. Social Worker. Number receiving aid from social worker_____

4. Remedial Teacher. Number receiving aid from remedial teacher_____

5. School Nurse-Teacher. Number receiving aid from school nurse-teacher_____

6. Attendance Teacher. Number receiving aid from attendance teacher_____

7. New York State Employment Counselors. Number receiving aid from employment counselors_____

8. Other.

C. Are case conferences on individual pupils regularly held_____, held as needed_____, never held_____.

D. How many case conferences were held during the 1967-68 school year?_____

E. If case conferences are held, check those who usually attend:

Principal
Teacher(s)
Teacher-Coordinator
Counselor
Attendance Teacher
School Psychologist
School Social Worker
School Nurse-Teacher
_____
Other

VI. Physical Facilities

A. Did the classroom provided for the STEP teacher-coordinator's use reflect the operation of a STEP program? Yes____ No____

B. 1. Was the teacher-coordinator provided with an office in which he could talk to students privately? Yes____ No____

2. If no, explain what facilities were available to talk to students privately.

3. Did the office have a telephone for the teacher-coordinator's Use? Yes____ No____

4. If no office was provided, what telephone facilities were available to contact parents and employers?

C. What audiovisual aids and/or special facilities are available for the teacher-coordinator's use?

VII. Orientation and Inservice Training

A. Describe all orientation procedures used to acquaint the staff with the objectives and procedures of the STEP program.

B. Were reports on the progress of STEP students made to teachers involved with these students? Written reports_____, Oral reports_____, None_____

C. Were reports on the progress of STEP students made by teachers for the teacher-coordinator's use? Written reports_____, Oral reports_____, None_____

D. Describe the inservice education procedures used to increase the effectiveness of teachers in helping to meet the objectives of the STEP program.

VIII. Parents

A. On the average, how many visits by the teacher-coordinator were made to each STEP student's home during the year?_____

B. How were parents of potential STEP students acquainted with the purposes and objectives of the STEP program?

C. How were the parents of STEP students kept informed of their son's or daughter's progress in the STEP program? (Attach forms used, if any)

D. Was a parents' meeting held to keep the parents informed of the progress of the STEP program? Yes____ No____

E. If yes, how were the parents encouraged to attend? What topics were covered at the meeting? What was the reaction of the parents to the meeting?

F. Indicate other methods used to contact parents.

IX. Advisory Council

A. Number of Advisory Council members_____

B. Check areas represented by Advisory Council:

1. Labor_____ 2. Business_____ 3. Industry_____

4. Board of Education_____ 5. Civil Service Commission_____

6. Municipal officials_____ 7. Social Agencies_____

8. Service clubs_____ 9. School personnel_____

10. Other_____

C. How many Advisory Council meetings were held during the year?____

D. What contributions were made by the Advisory Council to help plan, develop or evaluate the STEP program?

X. Evaluation and Follow-up

A. Evaluation

1. Were evaluation procedures outlined in the proposal for a STEP program in your district carried out? Yes____ No____

2. If yes, attach copy of report; if no, explain.

B. Follow-up

1. What was the reaction of the students to the STEP program? (Attach forms used to secure this information.)

2. What was the reaction of parents to the STEP program? (Attach forms used to secure this information.)

3. What was the reaction of the staff to the STEP program? (Attach forms used to secure this information.)

4. What difficulties were experienced during the school year in the operation of a STEP program?

5. What plans have been made to overcome these difficulties?

6. What plans are being made to improve the STEP program for the coming school year?

7. What procedures do you feel have been most effective in accomplishing STEP objectives? Explain.

Report of an Area-Wide Conference on Occupational Education--A System for Manpower Development (Tucson, Arizona, May 16, 1968).

MF AVAILABLE IN VT-ERIC SET.
Pub Date - 16May68 67p.

*CONFERENCE REPORTS; *VOCATIONAL EDUCATION; *MANPOWER DEVELOPMENT; EDUCATIONAL PLANNING; *MANPOWER NEEDS; SPEECHES; PROGRAM EVALUATION; EMPLOYMENT TRENDS; WORKSHOPS; SCHOOL POLE; SECONDARY EDUCATION; POST SECONDARY EDUCATION; *SCHOOL INDUSTRY RELATIONSHIP
PIMA COUNTY; ARIZONA; *AREA WIDE CONFERENCE ON OCCUPATIONAL EDUCATION, TUCSON, ARIZONA, MAY 16, 1968

A conference conceived to focus on occupational education as a system for manpower development in Pima County was attended by 113 key employers and administrators in business, industry, and education at Tucson, Arizona, May 16, 1968. Chief considerations of the conference were (1) the manpower needs in Pima County and Arizona, (2) the extent and adequacy of present occupational programs in meeting projected manpower needs, and (3) the implications for future planning, programming, and budgeting in an area-wide system of occupational education. Major speeches were: "Manpower Directions, 1975," by Richard Land, and a keynote address by Sarah Folson. Also reported are a panel discussion concerning the unique role of occupational education in developing manpower, and workshop reports of government and health services, wholesale and retail, services and tourism, manufacturing and mining, financial and real estate, and agriculture. RAMADA INN

TUCSON, ARIZONA

PREFACE

One hundred and thirteen key employers and administrators in business, industry, and education met at the Ramada Inn, Tucson, Arizona, May 16, 1968, to direct their attentions toward occupational education in Pima County. The conference was conceived to focus on occupational education as a system for manpower development, with special emphasis on the relationships of business, industry, and education.

The accelerating needs of business and industry have brought about an increasing need for the development of the concept of an area-wide system of occupational education. Therefore, the chief considerations of the conference were:

1. The manpower needs in Pima County and Arizona.

2. The extent and adequacy of present occupational programs in meeting projected manpower needs.

3. The implications for future planning, programming, and budgeting in an area-wide system of occupational education.

The workshop meetings were characterized by the spirit of open and direct discussions. Although no policies were developed as a result of the conference, a consensus of the group was achieved. The pages that follow attempt to capsulize the dialogue achieved as a result of excellent discussions led by a task force of outstanding speakers and group leaders.

The splendid cooperation of the Tucson Chamber of Commerce, Arizona State Employment Service, and Pima College was deeply appreciated. Special thanks are also extended to the co-sponsors of the conference, the Pima County Advisory Board, and the Arizona State Department of Vocational Education, without whose efforts this conference could not have been conducted.

It is hoped that this conference is the first of a series of meetings directed toward the improvement of occupational education in Pima County. If it serves as the first of a series of such meetings, then it will have accomplished its purpose. Admittedly, much remains to be done in occupational education for Pima County; however, it was felt that this was an excellent start.

Dr. Robert V. Kerwood
Coordinator of Occupational Education

A C K N O W L E D G E M E N T

The members of the Pima County Advisory Board for Occupational Education would like to express their appreciation to the Arizona State Department of Vocational Education, Pima College, Tucson Chamber of Commerce, and the Arizona State Employment Service for their excellent cooperation in the planning, conducting, and reporting of this conference.

Sahuarita High School	Archie Romney	Teacher, Auto Mechanics

Dr. Oliver Laine, President of Pima College, served as chairman of the conference.

Dr. Richard A. Harvill, President of the University of Arizona, welcomed the over 110 participants.

J.R. Cullison, State Director of Vocational Education, Phoenix, introduced Mrs. Sarah Folsom, State Department of Public Instruction (seated to his left) the keynote speaker of the conference.

Mr. Henry Quinto, President of Levy's of Tucson, spoke of "The Employer's Role in Occupational Education." Other panel members (left to right) - Dr. Marsden Stokes, University of Arizona, Mr. Gene Dorr, Assistant Director of Vocational Education - Phoenix, Allan Hawthorne, Assistant Superintendent Tucson Public Schools - District #1.

Richard Land, Arizona State Employment Service, presented "Manpower Directions '75."

Shown is the Manufacturing and Mining Committee which was one of the six topic areas explored during the conference.

PART I

WELCOME

OVERVIEW OF CONFERENCE

MANPOWER DIRECTIONS '75

WELCOME

by

Dr. Richard A. Harvill, President
The University of Arizona

Ladies and gentlemen, I am Richard Harvill, a member of the Pima County Advisory Board for Occupational Education which, together with the Arizona State Department of Vocational Education, is sponsoring this conference today on "Occupational Education--A System for Manpower Development." I am sure that this will be only one of many conferences that will be conducted in connection with the problems relating to Technical and Vocational Education in this community and in this country at large.

We are all familiar with the scarcity of manpower in the fields of Vocational and Technical Education. There is now a great demand for educational institutions of some kind to provide the manpower that will take care of these requirements. We have today a real opportunity in this community, and I am sure it will be realized as the community college, Pima College, developed under the able leadership of Dr. Oliver Laine, who is helping in this conference today. In fact, I think it was Dr. Laine's inspiration that led to this conference in the first place. I know of his keen interest in this field. I know of his experience before he came to Tucson in the field of Occupational Education. I am sure that we welcome him to this community and we desire to do everything possible to assist in this much-needed program. Certainly at the University of Arizona we feel that way.

There are about 900 community colleges in this country, and they represent the fastest growing group in the educational field. A little more than a million and a half students are now enrolled in these colleges. It is expected that by 1980 three million students will be enrolled in the two-year college. Of the total number enrolled, about 20%, according to the best studies I have seen, are expected to go on to the four-year institution. Unfortunately, according to a report developed by some very capable authorities just published under the auspices of the National Junior College Association and paid for by funds from the Carnegie Foundation of New York, the two year college, generally speaking, with notable exceptions has not produced a very large amount of prepared manpower in the field of technical and vocational occupations. In other words, these colleges have not been involved enough in occupational education, and the manpower needs have had to be developed elsewhere. Now a great many of the manpower needs will always be developed elsewhere. It is clear, though, that there is an urgent need and demand for the two-year college to do more than it is doing today. In a community such as Tucson that has a four-year institution to provide for the requirements of the students who want the four-year institution and who are qualified for a four-year institution to provide for the requirements of the students who want the four-year institution, the community college has a primary role to play in the field of Occupational Education.

I have seen figures that indicate approximately only 4 to 7 per cent, depending on exactly how you classify these people, of the technicians in the field of electronics, engineering, dental technologists, medical technologists, etc. actually have been prepared in the two-year college. There is a reason, of course, in some locations for the two-year college putting primary emphasis on more general education in preparation for a four-year institution. I have learned in talking with members of the

Board of the Pima College and in talking with Dr. Laine that it is acknowledged and well understood that we have a different situation here in Tucson, and to a very considerable extent the same thing is true in the Phoenix area. The University of Arizona for quite a long time has not attempted to develop as university programs the fields of technical and vocational education. We do it now to a very limited degree in the Continuing Education Division and a great deal of that may be taken over by Pima College when it gets into operation.

I've seen advance information and considerable quotations from a book called The Academic Revolution by Jeucks and Reisman, to be published and available May 21. I believe that this book will be worthy of reading because it is a comprehensive study of higher education in this country--achievements, difficulties, limitations, and unrealized potentials. It deals with such questions as the merits of educating a great many people who are enrolled in universities and colleges and whether we are actually educating many in a way that is not suitable to their aptitudes and interests. Whether or not we bring about more frustration than education is another of the questions discussed in this very substantial volume.

I know that we are all learning. I certainly don't profess to have all the answers. A meeting of this kind, in this community where the citizens have always had a part to play in defining educational roles and in participating in decision making, is very much to the point. I hope we never get away from the practice that the citizens of the community, state, and nation participate actively and understandingly in the determination of the educational roles of all kinds of educational institutions. Since most of the students today attend publicly supported institutions and since in Arizona it is more true than in most of the states, we certainly welcome conferences of this kind.

OVERVIEW OF CONFERENCE

by

Dr. Oliver Laine
President, Pima College

We certainly appreciate the opportunity, as I speak for Pima College, to join forces with the University of Arizona; and we look forward to many, many years of cooperation in behalf of the citizenry of our area. However as a newcomer, I feel somewhat as a man who entered his mule into the Kentucky Derby.

The outraged breed owners came down and said, "What on earth are you trying to do? Wreck this whole thing? You surely don't expect that horse - that mule to win the race, do you?" He said, "No, I just thought he would benefit from the association."

So I am sure that I and we representing Pima College will benefit from the association with the University and with all of you who represent many phases of business, industry, and government agencies in this area.

As Dr. Harvill said, nationally the community, or junior college as it is known here in Arizona, generally reflects the national average in terms of student selections for occupational choices or curricular choices in that about 70 per cent are indicating a willingness with which to go to the baccalaureate and only 30 per cent the occupational route. We have right from the start indicated that we will try to do things differently because there is a definite need for it; and we are planning right from the beginning at least a 50 - 50 split. Hopefully in the years to come, we can reverse the national trend and perhaps make our program 70 per cent occupational and 30 per cent in the university parallel; but it is going to take a good deal of effort on everyone's part. As Dr. Harvill has already said, we live in an age of constant change. Change is the only constant that we can bank on; and this, of course, is the reason for this conference today.

The benefits from this conference should be directed towards four groups of people to be served by occupational programs -- first of all, those attending high school, secondly, those who have completed or have left high school and are available for full-time study in preparation for entering the labor market, third, those who have already entered the labor market and need training or retraining to achieve stability or advancement in employment, and fourth, persons who have academic, socioeconomic, or other handicaps that prevent them from succeeding in regular vocational education programs. These are the groups to whom we should direct our efforts from the educational point of view, from business, from industry, and other agencies.

We have three primary considerations for this conference. They are: the relationships of industry, business, and education in manpower development, the accelerating manpower needs of business and industry, and that the educational

system which ought to become an effective instrument for the national good in the terms of manpower development. The latter consideration is just beginning to take hold.

From the panel members, we will learn somewhat of the adequacy and extent of present occupational programs in meeting the projected manpower needs. Also, we would like to find out what the implications are for future planning, programming, and budgeting in an area-wide system of occupational education and one which will involve, of course, as Dr. Harvill has said, the areas where the University can provide the opportunities and facilities; where the area high schools can pick up what they should be doing; and then Pima College to fit into the pattern in an appropriate and reasonable fashion.

So, with these long-range objectives, we believe that today's conference should have three desired outcomes as well. The first is that we should establish and maintain effective lines of communication between business, industry, and the educational system of Pima County. This is extremely important, and I am grateful to say there has been a great deal of effort put forth, even long before I came on the scene, which leads me to believe that this outcome will be a fact very soon if it isn't already. Secondly, we need the development of guidelines for planning, programming, and budgeting. Thirdly, we need to establish the concept of occupational education as a manpower development system which I said was just beginning to take hold nationwide.

You will notice in your programs that the groups will be divided into workshop topic areas at 11:10 a.m. On the overhead projection, you can see a rationale from the statistics shown there for the break-up of our conference into these groups. These are the average annual employment in thousands in '64 and '65. We have done some combining in order to facilitate discussion. Now we would like for you to give your best efforts in these workshop areas in discussing, first of all, the major trends in your area. In other words, what are the trends with respect to the average annual employment in the business area? Are they going up? Are they going down? Are they remaining steady? Then what are the implications and some of the major manpower needs affecting your business or industry? We need to know this before we can effectively act and respond. Then we would like for you to discuss the extent or adequacy of present occupational education programs in meeting present and projected manpower needs in Pima County and, most important of all, some specific implications for future planning, programming, and budgeting.

We see three types of involvement for you as a participant -- as a member of the total conference, as a round table discussion group member, and as a member of a workshop committee. While we have no preset positions that have been taken prior to the seminar, we hope that today's discussion will be straightforward and unrestricted.

With a brief look toward the program, the structure has been set for some discussion; and you will be hearing next from the Arizona State Employment Service concerning projections of those manpower needs. We will have a panel of our educational leaders who are actively involved in addressing themselves to these manpower

needs. A brief beginning will be made before lunch in the six workshop areas that we have selected. Then we are very pleased to have with us today Mrs. Sarah Folsom, State Superintendent of Public Instruction, who will give us a keynote address. She will discuss some of the benefits of occupational education for the public school system. This afternoon will be devoted to the soliciting of your discussion in the workshop areas with each group reporting to this conference, followed by a brief summary.

We are hopeful that we will have a stimulating and rewarding experience today. The substantial ingredients are here. We are discussing a most important area of common concern to all of you. We have the services of an outstanding group of people serving as speakers, consultants, and workshop leaders. We hope that we will be able to have a most successful conference today. Thank you very much.

MANPOWER DIRECTIONS '75

by

Mr. Richard Land
Manpower Economist
Arizona State Employment Service

It is ironic that the subject of this presentation, "Manpower Directions '75," has to do largely with technological change because it is just that very thing that has presented a problem for me this morning. You were going to see a tape and slide presentation which lasted 18 minutes. We have shown this about 100 times over the past 15 months with some very complicated equipment which has managed to work every time. We got some new equipment because we were afraid that sooner or later the complicated, old equipment would break down. It never did; but last night as we ran it through, it did break down. So as a result of imperfect technological change, we are stepping backward from the machine to hand labor this morning. I am going to attempt to convey the theme, "Manpower Directions '75," which would have been shown to you in the slide and tape presentation.

The history of our nation and of Arizona is among other things a history of growth and change. Population growth has slowed in the nation, but change has actually accelerated in recent years. In Arizona, however, we have had tremendous growth as well as change, especially since the end of World War II. This growth and change has been welcomed for the most part -- perhaps not with regard to the traffic jams we experience here in Tucson and in Phoenix and a few other things. Certainly the technological change which has brought such things as air-conditioning in homes, buildings, and automobiles has been welcomed. Technological change which has brought the tremendous electronics industry into Arizona with the increased earning capacity and the growth for the most part has been welcomed. It has brought some problems too. To underlie these problems, I would like to quote a few statistics:

Examples of growth: In 1950, we had an employed labor force of some 240,000 people. In 1965, this increased to a little over half a million. We project that in 1975, we will have an employed labor force of about three quarters of a million.

Examples of change: In 1950, better than one person of every five employed was working in some kind of agricultural pursuit. Today about one person out of every fifteen employed is working in some kind of agricultural pursuit. In 1950, one out of every fourteen employed was working in manufacturing. Today one out of seven is employed in some kind of manufacturing firm.

This may not mean very much by itself; but when we talk about the numbers with the tremendous growth that has taken place, it may be a little more meaningful.

100

For example: In agriculture, 49,000 people out of a labor force of 240,000 in 1951 were employed in agriculture. Today just 38,000 people are employed in agriculture. In manufacturing, 17,000 people were employed in 1950. Today over 80,000 people are employed in manufacturing in Arizona.

We still don't take into consideration the fact that along with the change in number has come about a great change in the nature of the job. Even though employment in agriculture has decreased, agriculture itself has not decreased in importance in Arizona. It is more important today than it was in 1950. Less hand labor is needed; however, more skilled labor is needed. In fact, there are job shortages in agriculture today. In manufacturing, you can probably guess that between 1950 and 1968 the nature of many jobs has changed. The nature of the jobs in manufacturing will continue to change. We have invested at a fantastic clip in plant and equipment in the development of our natural resources since 1950, but our investment in manpower has lagged. The academic and skill levels of our people have not kept pace with the technological change, and the results in Arizona is a labor imbalance.

Jobs are going vacant today, and yet we have 25,000 people unemployed in Arizona. We don't know just how many jobs are vacant, but we judge that perhaps half of these 25,000 people unemployed could be employed right now if they had the proper skill, training, education, and employment orientation that is needed to satisfy the requirements of the employer. The imbalance hurts both the applicant and the employer. The employers in Arizona have become aware of this imbalance, and it is in fact at the instigation of employers that the Arizona State Employment Service produced the book and the ill-fated tape and slide presentation entitled "Manpower Directions '75." Employers are concerned with the planning for the future by trying to offset or prevent the labor imbalance in the future. The purpose of "Manpower Directions '75" is to help employers and educators, both the academic and the vocational educators, to plan now on investment in people to meet our future manpower needs.

I will quote just a few of the projections in "Manpower Directions '75." First, with the current rate of training and continuation of growth, there will be a trained manpower shortage of 116,000 people in 1975. Nearly 250,000 new job opportunities will be available in the state between 1965 and 1975. These new openings include over 78,000 in professional, managerial, technical occupations, 45,000 in clerical occupations, over 16,000 in sales, 42,000 in service occupations, 34,000 skilled positions and even 32,000 semi-skilled positions. There will also be 5,000 more unskilled positions although these 5,000 represent a far lower proportion of the employed labor force.

Nearly 60,000 of the new professional, technical, and managerial occupations will require four years or more of college training. A large majority of the remaining 190,000 new employees will enter jobs requiring high school, vocational training, trade school, or community college preparation. The needs for Arizona's economy between 1965 and 1975 will make it essential that those with aptitude for college be aided and encouraged to secure degrees; however, new openings requiring completion of college represent less than one fourth of the total future manpower requirements. Thus, considerable emphasis must be placed upon vocational training

to provide qualified persons for these openings. The disadvantage in minority members of Arizona's potential labor force must receive special attention. Training programs must be designed to aid all those previously overlooked by economic progress. Particular attention should be given to members of minority groups who are currently employed below their potential achievement level because of discrimination and lack of opportunity in the past.

Discrimination in jobs is ending. It has not entirely ended in Arizona or in the nation, but it is ending. Unfortunately, an end to discrimination, even if complete elimination of prejudice and discrimination in jobs was implemented today, cannot make the effects retroactive. The negro who does not have the incentive to complete high school education, to obtain vocational training, or become embittered over his plight in life, cannot suddenly change over night with an end to discrimination in jobs. "Manpower Directions '75" has some long-range recommendations, and I will read just a few of them:

1. Develop an open communication chanel between industry and the educational system at all levels to provide schools, junior colleges, and universities with an early warning system of industry needs.

2. Emphasize, encourage, support, and participate in vocational awareness in planning.

   A. Begin to educate students and their parents at the 7th and 8th grade levels about the world of work, occupations, and occupational requirements.

   B. Emphasize the statue and dignity of blue collar jobs as well as white collar jobs, and continue this program through high school.

   C. Develop, cooperate, and provide for joint sponsorship in conduct for annual job fairs, such as part of the annual state fair or as a state-wide traveling show, by industry, educators, and the employment service.

   D. Encourage and support local schools to provide for counselors, who function exclusively as vocational guidance counselors to assist youth and adults in vocational planning and preparation.

   E. Industry should provide members of their staff to assist in and supplement vocational guidance programs.

These are just a few of the recommendations in our "Manpower Directions '75." As far as investment in plant and equipment is concerned, Arizona has taken a giant step. Concerning development of its natural resources, Arizona has taken a giant step. We must take another giant step forward -- this time with regard to development of and investment in our human resources. This step must begin now.

PART II

(Panel Discussion)

THE UNIQUE ROLE OF OCCUPATIONAL EDUCATION IN DEVELOPING MANPOWER

PANEL:

THE UNIQUE ROLE OF OCCUPATIONAL EDUCATION IN DEVELOPING MANPOWER

MODERATOR: Eugene Dorr
Assistant State Director
State Department of Vocational Education

Dr. Marsden Stokes
Bureau of Educational Research and Services
University of Arizona

Mr. Allan Hawthorne
Assistant Superintendent
Tucson Public Schools

Mr. Henry Quinto, President
Levy's of Tucson

Presentation by Mr. Eugene Dorr

It is a distinct pleasure to represent the State Department of Vocational Education this morning. We appreciate the opportunity to cooperate with the several sponsoring agencies in stimulating an exchange of ideas regarding manpower needs in Pima County. The outgrowth of this type of conference should provide focus on goals, establishment of patterns for program development, and create greater understandings plus enhanced communication between all interested parties.

We have a real need in our communities today to help all people understand more about the world of work.

1. How skills are changing (related so well by the Manpower '75 presentation).

2. How parents and children learn about jobs.

3. How students of all ages must understand that the most out-of-date term in education today is the term, "graduation".

4. How individuals develop the concept of the dignity of work.

5. How people learn work skills.

6. How to create an appreciation for every student developing some salable skill prior to leaving school. (note - I didn't say graduation.)

Vocational Education is dedicated to serving the needs of the following people, as Dr. Laine has already mentioned:

- high school youth

- post secondary or junior college students

- adults

- people with special needs at all ages

Vocational education has a commitment to the people of Arizona to provide occupational education opportunities to all people of all age groups. To serve this need, high schools and junior colleges must have available programs of occupational education to serve the people.

Pima County high schools offer a number of vocational programs. Continual review of present programs and expansion of vocational offerings is necessary for the high school youth.

A number of states in the country have developed extensive separate area vocational schools. The area vocational school operates in these states separate from high school and junior college educational establishments. In the area vocational schools of these states, a wide program of occupational education is provided for two basic types of people:

1. Those that have left high school and are available for full-time study in preparation for entering the labor market.

2. Those adults that need refresher or up-dating in their occupational areas

The area schools, then, in some states operate as another school district - building educational plants, employing teachers, and becoming taxing bodies.

Arizona has elected to have these same functions performed by carefully selected high schools and junior colleges. This is and can be a vital saving of taxpayers' dollars. However, it also means that each area designated high school and junior college district has to become serious in providing these same services of an area vocational school in occupational education.

Another way of looking at this relationship, then, between the designated high school and junior college districts and the Arizona State Department of Vocational Education is one of joint effort in providing occupational education for persons who have completed or left high school and who are available for full-time study in preparation for entering the labor market, as well as providing adults occupational up-dating and refresher programs of study. Beside the joint effort to provide the above, the Arizona relationship of junior college and vocational education endorses joint responsibility for occupational education. Certain designated high schools and each junior college in Arizona, then, serve the function of the area vocational schools.

This means that proper leadership and funding must be present to help solve manpower needs of government, business, and industry. Occupational programs needed by the state and community must be answered in a short time-span with space and instructional leadership provided. Programs of short intensive instruction are provided as well as regular established long-range programs answering continual needs for manpower.

Let me reaffirm that the State Department of Vocational Education has a commitment to the people of Arizona to provide occupational education opportunities to people of all age groups. To serve this need, vocational schools must be available so that people in all communities of the state will have access to occupational education.

This conference can provide a giant step ahead in communicating the needs and avenues for helping solve some of Arizona's manpower needs between now and 1975.

THE JR. COLLEGE ROLE IN OCCUPATIONAL EDUCATION

By

Dr. Marsden Stokes

It is a pleasure to be here this morning. The time of day being what it is, I don't think we have time to do like the gentleman who said on one occasion, "I'd like to make a few remarks before I say anything."

I'm an educator, but I have been a businessman too; and I have met the payroll. I have raised the money to meet the obligations due on the 10th of the month; and I have negotiated with the bank on a floor plan for my merchandise. So I have some feeling for the problems you face too. As I look into my topic a little bit here, and consider the unique role of occupational education, particularly in the junior college which was my assignment to discuss with you, I think back to the time, as a seventeen year old, when I finished high school. My father said, "Well, son, you have completed high school. Now what can you do?" I thought a minute and I knew what he meant. I said, "Nothing."

After two years of college (at that time one could earn an elementary teachers diploma), he asked me again what I could do. I saw that his expectations were orientated to the world of work. I won't tell you what my answer was that time. I would say he was a little concerned. In fact, his words were a little strong!

As we look to the junior college entity, we should see a little about its philosophy First of all, the community college philosophy is characterized by a belief that the nation's most valuable resources are her human resources. I think it fundamental that we understand this point. There is a belief that these resources must be nurtured optimumly by appropriate types and levels of education. There is a belief that such training will redound to the advantage of the social, civic, and economic life of the nation as well as to the betterment of the individual.

The basic functions of the community college are many; and I think if we are going to understand how the whole framework of occupational education fits into the picture, we need to have at least some little overview of what some of the functions of the institution are. One of these is the preparation or college transfer function. We are well aware of this one. It plays an important role.

Then there is the terminal or semi-professional function. (Here we have a word I wish we could get rid of - terminal - because I don't like to talk about terminal education. Education is an on-going process, a life process; and according to my philosophy of life, probably the only thing we take from this sphere of existence is what we learn here). I believe we think of the semi-professional function primarily here. The trade-level vocational programs may or may not be a part of this function. I have a little bit of feeling that perhaps the semi-professional and technical levels are more for the junior college.

Also, we have the counseling and guidance function. This is helping the students find their places in society and making adjustments to it. It includes the selection of, preparing for, and entering into an occupation.

Another function of the community college is the matter of providing basic skills and general education. Again, there is a rehabilitating and democratizing function Some people call it a salvaging function. Here we serve the non-high school graduates, the students who fail to satisfy the four-year college entrance requirements and the individuals who could not normally afford post-high school education. It assists these in contributing to a democratic society.

Furthermore, the junior college or community college has a community service function, and it has a retraining and updating function for adults changing employment voluntarily or otherwise and for those whose skills and competencies in their present employment need updating or maybe extension. We could cite others. You see, there are a great many functions of the community college. Occupational education is related prominently to many of them.

Now it is true that 70 to 75 per cent of the students entering junior college today are in fact terminal students. They are those who are not going on to the four-year institutions. Another thing that is probably interesting to think about is that 60 to 70 per cent of the enrollment in the community colleges are those in the 18 - to 21 - year-old group; but in saying that, let's keep in mind too that this means that 30 to 40 per cent are in older age categories.

As you look to possibilities of finding those who could work in your industries and businesses in the years ahead, think that the junior college is going to be a source for getting such individuals. It is said that many employers really do not want to take youth fresh out of high school That, in fact, they want to employ somewhat more mature individusls. I think in many cases this is true.

A community college has a distinct or unique opportunity to provide occupational education to meet certain manpower needs. In the first place, the community college is still a young institution. It needn't be tied to tradition. It should be close to all segments of our people. This is quite fundamental and this is where some of the uniqueness comes. Not all of our higher educational institutions are.

The junior college may draw upon labor, business, industry, and other sources for some of its instructors. Think what this means to some of you and those with whom you work. It is not restricted to the use of degreed persons as teachers for many of the educational opportunities that it presents. Of course, many of them need to be certificated today; but not all of them, and particularly in some of these fields where we need to quickly train and retrain individuals. The junior college may adjust to certain training programs to the length of time needed to prepare an individual for a job, be it a matter of a few weeks, a semester, a year, or maybe a year and a half. It doesn't necessarily have to be tied down to a semester or a quarter hour situation. In this I see some real hope. I see something like this going on today at Maricopa Technical College here in our state. They're bringing in the groups and giving them the occupational education they need for a job that needs to be done.

Having served for a period of time as the one in a state education office who had general control and supervision of area vocational-technical schools and of a junio college, I think I need to leave a word of caution here. That is, there is some trend among certain individuals working in our community colleges to work toward what they would call "academic respectability." Let's not get caught in that bear trap. I see some tendency on the part of some of the academicians among us to think in terms only of transfer programs as being of real importance. I can't buy that at all. We've got to really watch that; because if we don't, we will see that we have "some of the same" that is already acceptably offered elsewhere and technical and semi-professional offering will not receive the attention deserved.

I think the junior college or community college can do a really good job in the technical courses. Perhaps from technical courses with considerable academic background we get a major loss to the four-year institutions but that's all right too.

In the state of California, vocational education in the junior college trade apprenticeship program really hasn't worked out too well I am told. I suggest you investigate the situation there before attempting similar programs. Think about it as you look ahead to 1975. There have been some problems with Board of Apprenticeship standards. You have federal involvement, local involvement, employer involvement, and trade union involvement here. The schools are not necessarily set up to pay a master tradesman to set up in preparation for his instruction and clean up afterwards.

As we look forward to the establishment of Pima College, I hope you people will not think of persons who withdraw from the institution to enter business and industry as we think of the school dropout. It could well be that the college has succeeded The person who has withdrawn to enter the world of work after getting what he neede at Pima College or any of our other junior colleges is worthy of full employment. I think we should quit calling these fellows dropouts. These persons are successes They have "made good."

There is one other area I think so fundamental I just can't avoid mentioning, namel vocational counseling. I need to have a minute with you on that because to me the counseling program is the real heart and soul of occupational education. Now I'm not belittling the instructional force; I want to emphasize the whole counseling function and the work of counselors. They're going to be key men in what we are going to do in our country and what we are going to do in the years ahead here in our state. These people need to know the world of work. They need to know the manpower needs, and they need to know what the rewards offered are. I think they need to have some work experience themselves. It would be well that they had some before they entered service, and it would be well that they had opportunities to get out into the world of work now and then during the summer months.

I think there is need for counselors to attend conferences with business and industry and rub shoulders with you people. There is need for them to have many, many interviews with personnel directors; and you people should look forward to this and get them into your places of business and industry. There is also need for them to work with advisory committees. (Mr. Cullison, I surely hope that these

counselors are in with the advisory committees, as are the instructors and administrators.) I think it is basic. They need to know what they're talking about, what is current, and what is in demand. They should have a better understanding of adult problems that are related to occupational entrance - for instance, for women past the age of 40 who are going back to work. There may be need to convince these students (that is, some of them that we wish to rehabilitate) of their worthiness. There must be a genuine commitment to the worth of the individual soul and a sense of the heavy responsibility in the area of helping students realize the possible discrepancies sometimes between their aspirations and their abilities.

I have given special emphasis to the counseling area; I hope you can see why.

It seems to me the junior college or community college is going to have a real impact in our country and in our state in the years immediately ahead. I think they're going to do far more by way of contribution than evidenced in the story of the judge who said to the pickpocket "Before I pass sentence, what have you contributed to society?" The pickpocket replied "Well, judge, I have kept three or four detectives at work!"

THE ROLE OF THE HIGH SCHOOL IN OCCUPATIONAL EDUCATION

by

Mr. Allan Hawthorne

I don't know of any group of people that has looked forward with greater eagerness to the development of the junior college than the high school people of Pima County. We have seen many short comings of the four-year institutions, and we have seen some of our own short comings. We have especially seen shortsightedness in respect to the attitudes of the people of the community towards occupational education, and we hope that the junior college will make it worthwhile for parents to encourage their youngsters to look into these fields instead of thinking almost solely in terms of college preparatory work.

In thinking of some of the roles of the high school in occupational education, I might review a little bit with you the traditional ones which to a certain extent are exploratory. We are trying to help the young to answer the question of what you need to be able to do to become a secretary, auto mechanic, architect, or electronics engineer. Typical exploratory courses such as general metals, woodworking, typing, bookkeeping, marketing, mechanical drawing, electricity, etc., help them get a start in that direction. What are the opportunities in the broad field of that line of work? What are the other kinds of occupations that this job leads into What does an employer expect.? How do you help a youngster find that information? Bring in employers who talk to classes and explain what they are looking for. They also answer questions of the students. Of course, many of the students want to know how soon one can advance and become the boss or head man on the job. Everyone, it seems, wants to start at the presidency.

As a youngster's interest develops, he may enroll in classes that emphasize the development of skill. Here he finds quite soon that he is getting on a ladder - a ladder of skill or degrees of skills, primarily because of the development of his own skills, his attitude and the other desirable qualities that employers are looking for. Strangely enough, all the students do not fall into the top ten percent of what everybody expects. As we listen to people asking for the qualifications of and recommendations for students, everyone is looking for candidates who fall in the top ten percent, whether they go to college or whether they seek employment. You and I know that this is not true. We don't expect it of baseball players, but we do expect it of high school youngsters.

As a youngster moves from his fourth year in high school, he might go into further education at the junior college or at the technical level or he might go into some kind of employment in which he can continue to advance in evening school programs or on-the-job training in his own company. Here in Tucson, there are not many companies large enough to provide that kind of opportunity.

We try to develop courses on the basis that there are several levels of job-entry for a youngster. I will give you as an example - practical nursing, which has recently been developed in this community and one other district in the state. Some students from this program have gone into the college registered nurse program; others into our advanced licensed practical nursing program and others directly into hospital or nursing home work as nurses' aides.

When we consider another role of the high school - which is to try to develop training opportunities for youngsters in accordance with the needs of the community, we find some of our biggest problems. The many changes in occupations make it difficult for a school system to keep up-to-date. Also, many lay people and educators tend to think in terms of vocational education as they have known it back east or on the west coast where emphasis has been on industry; mainly, heavy industry.

We have heard a great deal of talk about the need for more and more industry in Tucso The school has the problem of learning what kinds of industries are moving into the Tucson area. What can we provide for? How can we plan? It takes time to plan. It takes time to get equipment and teachers. It certainly takes time to find the funds.

You heard a brief report this morning from the Arizona State Employment Service "Manpower Directions '75. I wish you could have seen the visual presentation because it would have helped a great deal to understand a little bit better the picture for Arizona and maybe even for Pima County. The authors predict a shortage of almost 117,000 people to fill jobs in Arizona in 1975, taking into consideration immigratio and the development of people already in the state, such as graduates of high schools technical colleges, junior colleges and four-year institutions. An interesting poin they make, however, is that there will be sufficient population in the state to handle those needs. We don't have to go out of the state to find 117,000 more people. The problem is in the degree of skill and the level of skill of the people available. The minority groups who are unprepared for jobs, the handicapped people, the youngsters who learn no skill while in school, and the "dropouts," will form the labor pool. They will need the opportunity to learn employment skills in order to make a living as well as to take care of the shortage of labor in Arizona.

Now here again, the schools have the problem of what kind of programs to develop for those people. I think you have seen a shift from the traditional vocational programs to those of the service type of occupations in the Tucson area. We have seen the addition of day-care nursery training, supermarket training, pre-practical nursing, refrigeration, air-conditioning, vocational drafting, diesel mechanics and horticulture, starting this coming year. Most of these fall in the category of service occupations because we still seem to be that kind of city. For years, we have offered agriculture, auto mechanics, printing, photography, welding, machine shop, electricit electronics, cooperative merchandising and retailing in the metropolitan area.

Now let's consider the needs of the individual, the dropout, the handicapped person and the youngster that has no long-range goals who cannot look into the distant futur and does not fit into patterns that society has developed. There are human beings such as they. We need to modify the schools to help this kind of human being develop because none of us have developed at the same rate nor followed the same prescribed time schedule.

We need to provide occupational education for students of lower ability than we have in the past. We have concentrated on high skills and ability. We need to reorganize courses to provide more time for slower students. There will not be enough of the top-skilled people available to supply the demand according to Arizona's needs, as we read these reports that have come out from the Employment Bureau. This means that as employers, we will have to reorganize the structure of our jobs so that the top-skilled people are spread over wider areas of responsibility and are supported by the lesser skilled people. We need to subdivide into several kinds of lower skil jobs. This, in turn, as far as high schools are concerned, means we need help with ideas from employers as to what are the different kinds of subdivisions possible and the kinds of training that will be needed. Interestingly enough, we will probably find that we don't need everybody to have a high school diploma in order to perform some of the jobs. There are employers in this community that do not require high school diplomas for everything. There are a few that are experimenting deliberately in the hiring of minority groups. They are finding that people are performing at a higher level than the pre-employment tests would have predicted in many cases. This is very encouraging when you think of the total picture, and particularly encouraging for the young person of this community who hopes to become a useful citizen with the help of industry, business, and education. The other alternative is going on welfare roles, I believe.

We will have to develop courses in high schools that are of shorter duration to fit the needs of the people who do not conform to the usual pattern of four years of schooling. In some instances, we will need to provide a certificate that indicates the general level of education as well as a more specific level of skill which a student has acquired. Many youngsters have short-range goals. They do not think ahead to four years of high school. Most of you, as your children grew up, have told them, "When you get out of high school, you will do this. When you get out of college, you will do that." The pattern of the future has been set for your kids and my kids. There are people in this community that have not set such goals. Their short-range goals are to get a job as soon as they can, to have a car, a couple of girl friends and worry about the future after that. I don't believe that we can change that.

If a youngster drops out of school at the present time, what happens? He has little if any, skill and he is faced with social stigma as well. Somehow we need to change this process. We need to give him a chance for some kind of skill that doesn't require four years of high school. The employer has to give him a chance to try to develop on-the-job. This is not easy as far as employers in Tucson are concerned. Many operate small companies that cannot employ extra personnel. We need some federal funds to help reimburse employers for providing training opportunities for people.

We have, at the present time, a Manpower Development Program which is doing the kind of thing I mentioned for out of school youth. I hope we can develop short-range programs on specific skills to help the youngsters before they get to the point of dropping out. Now the fact that these young people vary in their kinds of abilities, interests, attitudes, and goals in life brings me to the last point I wish to make. Occupational education has to be considered as a part of total education.

In this country, we emphasize college education. We emphasize it in our advertising and practically everything else we do. We think in terms of college education or occupational education. Youngsters select high school courses on the basis of whether or not they're going to college. A student often selects college prep subjects to give the impression to other students that he is going to college. He starts college and then drops out and still has no skill as Dr. Marsden Stokes indicated a few minutes ago. We need to help these youngsters enroll in occupational education courses in high school as well as the college preparatory courses. Many of them will have an opportunity to earn their way through college. Many will have a means of discovering an occupation that will lead them to more meaningful careers in college. Nothing is more frustrating than four years of college and still not knowing where one is going.

The fine cooperative program that we have developed in Tucson with the help of the employers, in the field of industrial education, office education, retailing, and distributive education, have helped the youngsters gain an understanding of what it is like to have a job. The programs have helped the students to mature and to find out what it takes to earn a living and to become responsible young citizens. One of the great needs is in helping parents and adults understand opportunities in occupational education. Students are influenced, I believe, mainly by parents, by the people in their community, and by their friends.

The role of the high school is to help young people develop the attitudes and skills that will help lead each of them to a successful life with or without a diploma, moving into employment, or moving into the next level of education.

The modern young person is competing with students all over the country for his future life's work. Youngsters in every one of our high schools are competing with students all over the country because modern people are on the move. Students are not only competing for jobs in Tucson or in Arizona, but they are competing for their future. He needs the best possible preparation at all different levels.

THE EMPLOYER'S ROLE IN OCCUPATIONAL EDUCATION

by

Mr. Henry Quinto

In spite of what Dale Carnegie may say, this is one businessman that does not get paid for public speaking; and I am going to try to be very brief.

From the beginning of time, occupational education has been an important business function; but today as America grapples with major sociological and economic problems that have reached the crisis state, occupational education has assumed new importance in the eyes of business, particularly large business. I might add too that interest of the businessman is spilling over into the field of general education as well. Today many industrialists are taking a real interest in local school systems.

Historically, however, the concern of business has been with the need to train for the specialized fields that are used within its own plants and shops. Up to this day, much of this training was accomplished through apprenticeship, wherein a young worker learned at the feet of an older one. As a practical matter, however, minimum wage laws today demand that a young worker become productive quickly - much more quickly than in the past. For that reason, I for one think that the apprenticeship system is on the way out. The training, therefore, is more sophisticated. You can divide this between training in the plant and training outside the plant. Probably most familiar to the lay public are the training classes that are developed by companies on their own, using their own resources and held completely within their own shop in Pima County. Possibly the most notable example would be found in the Hughes Plant where they use either their own skilled people or supplement them with specialists from the outside. They run formal training classes within the plant to teach specialized skills and to upgrade their people. Now this applies primarily to the crafts.

In Pima County, we have another specialized occupational education; and I refer to a Motorola Institute where the students, as I understand, are generally at the Vice Presidential level. This is a rather different thing, but I don't think it has general application. There are, however, other companies doing somewhat similar things. In our own store last year, for example, we developed our own resources and ran a training program of some 25 or 30 lectures for the younger people in our organization who were either already at the junior executive level or prospective candidates for that level.

Another type of important training, the cooperative education type, was done within the plant. This in my mind is a Godsend in a situation like ours where most of our businesses are small and cannot afford the training facilities that major corporations have. This works very well not only from the business point of view in providing an input of young people who, when they finally come on the payroll full time, are very well-trained and very familiar with the procedures of the particular business. It also has an enormous sociological impact in providing the motivation which is so desperately needed today to keep our young people on the track.

Lastly, I might mention on-the-job-training. Most of you, I am sure, are quite familiar with it. There are many agencies involved with it today - both the governmental type such as M.D.T.A. and the professional non-governmental type like the Urban League. Business is looking more and more to this kind of assistance. As I said before, business uses outside facilities very frequently. For example, there are a number of firms in town that use the University of Arizona's facilities in various ways for occupational education. In some instances, particular courses have been tailored to businesses' needs. In other cases, businesses will pay for what we call broadening courses for the younger executives. Generally, when the young man has taken a course agreed upon in advance and successfully completed it, the business will refund his schooling costs.

Then, of course, we have the prospective community college; and we are looking forward to that eagerly. Allan Hawthorne has discussed high school in detail. I migh say that there is an increase in interest in local business circles in being more closely tied to and more helpful in developing more of a partnership with the high schools in connection with the vocational courses. In the past, unfortunately, the schools have been left frequently to develop what they thought business wanted and hoped that the graduate would be acceptable to business when they went out into the labor market. Today, there is a real effort in some business quarters to lend a hand in making sure that those courses will lead to jobs.

Some companies also are using out-of-plant facilities which are run entirely by their own organizations. I am referring to something like Lee Beaudry's company. Here you get major corporations which set up regional schools to which the dealers send their employees for advanced occupational education, generally leading to upgrading and generally concerned with very specific skills.

I would also like to put on the list the correspondence courses. Today in our sophisticated swinging society, we tend to look down our noses at these. I think we make a mistake in doing this. I think some businesses are rediscovering the value of correspondence courses in situations where they are not equipped to do training themselves.

Lastly but not least, there are any number of what we call poverty war programs which have been developing with the cooperation of business, frequently by chance and in a response to requirements of local situations. In Phoenix, for example, they have a rather considerable program which has developed through a partnership with business. Here the manager of a rather large plant was having difficulty in getting office people and he said to someone "Look, we're closed at night. We have the equipment here - electric typewriters, computers, and what not. If you can get some classes started, we will lend some of our people as instructors; and you can have the use of the plant and equipment, etc." That has since developed into a rather extensive program which is financed by the business community and is very properly considered to be business interest in occupational education.

In all of these things, the employer's role has been that of one who uses education as a tool to make his people more productive. We generally have started in the past with people who represented the cream of the available labor market. Two

things have changed, however. In many areas, there is no longer an abundant supply of well-educated workers. Allan Hawthorne has referred to the survey which indicated a shortage of the kinds of people business has traditionally been able to employ at starting levels without any problem. Now we have problems. The other thing that has happened in American business is that it has grown mature. It used to be characterized and castigaged as a collection of soulless corporations. Today I, unequivocally, say that it has advanced to a stage of citizenship where it has a conscience and moral motivation equivalent to that of an individual -- no better, no worse. There is a conscience, and there is a moral motivation. So today business finds itself dealing more and more with people from what you might call unoriented subcultures of our society. These people do not easily fit into the worke ranks.

From this flows businesses' interest in the general school system. When an employe finds that he is offered only dropouts, he is bound to become vitally concerned wit the dropout problem. That is why reference to the counselors is so meaningful. We haven't done it here yet on the grand scale. There are a number of cities which have run very large and very well done vocational guidance institutes which were sponsored by and for the benefit of business. Because it is increasingly dealing with a new class and a new type of worker at the entry level, business finds itself involved with things that is just wasn't involved with a few years ago - a pre-job orientation for example. Five years ago in most of the country, it was incredible to visualize business concerned with teaching people how to go about gettina a job and what to do after you have got it. I am talking about detail at a very fundamental level. I am talking about teaching people why you must comb your hair, why you must wear non-hippie clothes, why if the rules are you report for work at 9:00 you must not come at 9:20, and why if you are sick you should call in and say you are sick and not leave the firm wondering whether you have quit or gone on vacation In Miami, the business community raised $50,000 to finance just this kind of occupational education.

Now having given some of these people that kind of training, business finds that they still need other training. They still don't have in some areas the three R's. We haven't run into that, fortunately, so much locally; but it exists on a national scale. There business has been doing two things. They have been running pre-entry classes for people they have selected for hiring generally on a contract basis with the local schools or church groups or what have you. In some cases, they're doing post-entry generally under what is called an earn-as-you-learn program so that they may spend an hour or two a day learning the three R's and the other six hours doing the job. He gets paid for the whole eight hours.

In the course of this, business has had to take a close look at the question of entry tests, which have been a Bible for years. It has had, in some cases, to fractionate jobs in order to reduce them to a level that can be handled by people with less skilled backgrounds. Lastly, it has had to develop new courses in some areas to upgrade people who previously were not considered for upgrading. They are the people from the disadvantaged areas who obviously would have to come in at low entry levels. The only way business has been able to do this is to upgrade the people who already occupy those jobs and who have never been considered as promotional material.

I had an occasion last week to talk with someone from one of the major aerospace firms. It has revolutionized its thinking and also called for a rearrangement of its inplant training facilities. They want to promote people whom they have had on the payroll if they can in order to create more openings. This is going to have a very profound effect on business thinking in occupational education. Business is learning a great deal as it expands its educational functions; and as I said before, it uses its own people and outside specialists. I think there is an interaction. It is creating a market for teaching machines of various kinds. There will be beneficial affects in the academic industry.

I read an interesting article recently about Montgomery Ward's programmed instruction where most of the teaching is done by the students themselves and the company is able to accomplish what it wants with relatively few supervisory hours. There may be a lot to learn from that. In essence, it seems clear to me that business today is interested in education internally and also externally and will be more so. Business recognizes that its progress today equates with educational prograss as our world becomes increasingly technologically complex. The business role, therefore, must be one of a supporter not only morally but with dollars, a catalist, and a coordinator; but in any event, it must and will be more and more involved in occupational education.

PART III

PRESENTATION BY SPEAKER - LUNCHEON MEETING

(Keynote Speaker)

Mrs. Sarah Folsom
State Superintendent
of
Public Instruction

It is a delight and an honor to be here today, and I bring warm greetings from the State Department of Public Instruction. I feel that this is one of the top meetings in the state at this time or any other time. I will say again, it is a pleasu for me to be with you and to have the opportunity to talk with you for a short time on occupational education.

The Pima County Advisory Board for Occupational Education has done a very wonderful thing in drawing together all of these fine people, representatives of industry, government, business, professions, and education. It is your thinking that is so important to Mr. Cullison, his staff, and me as we try to plan the future of vocational and technical education in this state of Arizona. Each of you is equally valuable to us for the advice and counsel you offer. I think it wonderful that you in this area have such close cooperation between industry, business, profession and education. I would like to see your example followed by each of the 14 counties. We would have a far better system of education in this state were this to be true. I am delighted to see this splendid working relationship in this area.

We are on the threshold of a new and exciting era in education in which vocational education is emerging as a most important segment. For many years, we have given lip service to the concept of providing comprehensive educational curriculums in our high schools; but in contrast to our stated philosophy, many of our high schools have offered very specialized curriculums geared to meet the needs of those who are college bound. Tax payers and educators alike have accepted the idea that we have an interesting number who are not well served by the typical college preparatory curriculum. Local boards of education and administrators have been reluctant to alter their programs for two reasons. First, college entrance requirements tended to give priority to selected academic educational courses; and secondly, the additional cost of vocational-technical education especially in those districts with limited funds made for much difficulty.

A few months ago in Cleveland, I was invited to speak before the national meeting of vocational education people. After my talk, at the coffee break one of the five top industrialists in the world came up and talked to me. Talk about women talking he could really talk! I couldn't get a word in. So when he paused for a breath of air, I hurriedly had my little say. This brilliant industrialist was telling me that if he had his way he would take all of the occupational education away from public institutions and contract all of it out to business and industry. On and on he went. He would build his schools right by the public schools. Evidently, he was very bitter. He would show the difference in products.

When I could get a word in, I asked a question. I said, of course, you are planning to spend the approximate amount of some $450 per student per year. He gasped in horror, and said "Oh, no, Mrs. Folsom, $3,000, $4,000, $6,000, $8,000 per year per student." I said, there you have placed your finger on the sore spot. Give our administrators and county school superintendents adequate support in occupational education in our secondary schools and in our junior colleges, and you will see a vastly different product, although I must say I feel we have done a very wonderful job with the monies available. We have to think of the financing of these programs.

We find ourselves, today, facing so many challenges in all areas of the social, economic, and political scene. But in none of these are there greater challenges than those confronting us in education. We have been given the mandate and the challenge to meet the occupational education needs of people of all ages, in all communities in our state.

Our only hope for meeting the educational needs of all youth in the years ahead is to offer a balanced program of education which is challenging and meaningful to all youth. It is an adding to rather than a taking away process which serves those who are vocationally talented as well as those who are academically talented. A balanced program serves those with few talents as well as those with many talents. It serves those who are specialty-oriented as well as those who will pursue a baccalaureate or higher degree.

It is appropriate to the needs of those who have socio-economic handicaps as well as those from the more affluent segment of our society. It permits the slow learne to enter and progress at his own speed and level of ability in his special area of interest while others are pursuing courses and curriculums that are just as appropriate to their needs and abilities.

Another challenge confronting us in providing a balanced program of education is to place the proper emphasis on the various vocational programs according to employmen needs. Although more than 50% of our work force is employed in the fields of marke ing and distribution, many schools are slow to shift from the production-oriented vocational-technical courses to those occupations in which recruits are in short supply.

To be completely frank, I think that most schools should not reduce their curriculu offerings in the production trades but simply increase their output in the fields of marketing and distribution, including training for office workers and service occupations, <u>especially health occupations</u>.

If we are to implement the philosophy that we should educate youth to their optimum or maximum potential, then we must become concerned about what happens to all youth on leaving the high school or junior college; just as concerned about the welfare of those who enter the labor market as those who enter the four-year college.

Only by providing a wide variety of occupational education offerings that meet the needs of workers in today's work force can our public education agencies hope to become sophisticated in the eyes of those we serve; and only then, too, will we be delegated a major role as a manpower development agency.

There is much evidence to support our public education institutions as very efficient and economical agencies for training manpower. Unfortunately, however, much of the money appropriated for training has gone to the emergency rescue programs that have no history to justify such support and whose subsequent performance in many cases has not equaled or even approached that of our public school programs in economy, efficiency, or quality of program.

Fortunately, the vocational education act of 1963 is one of the few permanent pieces of legislation that Congress has passed to provide occupational education. So, as the others are phased out, our public schools and junior colleges will hopefully be given an even greater role in creating an adequate supply of trained workers in the years ahead.

If vocational education is the key to a better and more productive life for a large segment of our youth, and if our schools are to assume an even greater role in manpower development, we must be ever alert to explore new and better ways to better meet their needs. We must innovate, experiment, and plan pilot programs in an attempt to provide programs that are high in quality, efficient, and flexible enough to keep pace with our changing technologies. Training components of each should be rightfully delegated to our high schools and junior colleges.

The State Employment Service projects a deficit of 116,000 trained workers in Arizona by 1975 based on the present rate of training by the various agencies involved in manpower training and assuming that other variables such as inmigration and attrition, remain constant. This is a rather awesome figure when compared to a total projected work force in Arizona of only 750,000.

This suggests to me another very important challenge that confronts us in the future; that is, the need for more and better vocational counseling. Highly qualified teachers, newly constructed laboratories and shops and modern equipment are not sufficient to assure an adequate program of vocational education since nothing happens, unless it happens to the individual student, and this can happen in proper numbers only when youth and adults enroll in and pursue training toward a chosen occupational career.

I have no quarrel with the present performance of our public school counselors or the counselor training institutions in meeting the needs for educational counselors; but equally important is the need to provide vocational counseling which most of the present counselors are not properly qualified to perform. Counselors who are educationally oriented, but are not familiar with the world of work, can hardly be expected to properly interpret career opportunities to counselees.

I will mention the National Advisory Council's recommendation that, "specific job training should be given in high school to all students not planning to go to college and two years of post-secondary school training in advanced skills should be offered free as a part of the education system."

Many states sponsor a statewide system of area vocational schools that are separate and apart from the public secondary schools and junior colleges, but we have elected to meet this need through a sound program of vocational-technical education in our high schools and junior colleges. Obviously, these curriculum offerings should provide job training in occupations where there is a reasonable chance for the student to find gainful employment as soon as he enters the labor market.

There was a time when one could drop out of school and gain adult status by finding a job soon after leaving school; but, today, it is easier for most youth to enter college than to enter the work force.

In fact, there is a paradox in our society today in which good jobs are going begging at the same time that out-of-school youth and adults are unemployed.

We cannot properly appreciate the importance of providing an adequate program of occupational education through our public schools without first looking at a profile of our work force. Here we see that about 12% of our workers are employed in occupations that require a baccalaureate or higher degree; 7% are in the so-called unskilled occupations, which leaves about 81% in occupations that require some type of vocational or technical education.

In Arizona, only about 27% of our high school youth and the same proportion of our junior college youth are enrolled in occupational education courses that are career oriented.

I do not believe that our public schools have accepted their full responsibility as a major manpower training agency nor have they been delegated this responsibility, but I believe they can and should become more effective in manpower training.

Business and industry, including both labor and management, must also share in the challenge of developing an adequate and well-trained work force. Today, education is everyone's business, not just the domain of professional educators. Unemployed and under-employed people weaken the economy of our country. We all know that inadequately trained manpower creates poverty, wasted lives, and unused talent.

The business community should provide active leadership and assistance to vocational educators in establishing programs that adequately meet the job needs and requirements of today and tomorrow's labor markets.

Business and industrial people should seek to serve on vocational advisory committees, to review course content, equipment needs, and help locate training stations for cooperative part-time training programs.

You may be saying, "Yes, I agree! But how does the business community get involved?"

Two-way communication lines need to be established and used so that business and industry needs and requirements are made known to school personnel. Industry should provide ample opportunities for educators and students to learn firsthand what is happening on the firing line of business. Likewise, educators should continually seek to have business and industrial people visit the classroom as speakers, advisors, consultants, and sponsors of training stations.

Vocational educators need to be constantly aware of what changes are taking place in the working techniques of industry. Opportunity for summer placement in the actual job gives up-to-date work experience to the vocational teacher. Work habits and new techniques are studied in a "learning by doing" process by the teacher and shared with his students the next year in school.

Educational efficiency if important to all parties in vocational education. As the costs of education continue to rise this requires an intense concern for improved efficiency on everyone's part. Radical shifts in manpower needs can cause rapid obsolescense of certain occupational skills. The industrial community needs to alert educators to these changes.

Everyone in the business and educational community must understand that the goal of education is to enable the individual to enter the work force at a level close to his maximum capacity.

Business and industrial people may need to review their job requirement specifications. Many firms leave the impression that a college degree is essential for a responsible position with good pay. In actual practice, many of these positions can be filled by two-year college graduates who have majored in a vocational-technical education program. An article in the March, 1968, Reader's Digest entitled "High School Graduates: Business Wants You!" spells out the need for business and industry to provide realism in job specifications.

Our challenge, then, is for educators and people in business to become acquainted, share thinking, and assist each other in developing realistic programs of training for the world of work.

I am proud of the placement record of our vocational graduates in which 70% of those who majored in vocational education in high school last year and were available for placement, found gainful employment in the occupational area in which they were trained; and 93% of our junior college graduates majoring in vocational education, who were available for employment were placed in their chosen career or one related.

Since the junior college is terminal for 70% of those who enroll, a balanced program of education that will meet the needs of the 70% who will enter the labor market on leaving the junior college is even more urgent than at the high school level.

Some educators would contend that youth should not be required to make an early career choice and I agree, but I also believe that adequate occupational information and exploratory experiences in the world of work should be made available early so that those who plan to enter the labor market on leaving school may have the opportunity to develop a saleable skill before they leave school.

I do not believe that counselors alone can do the job; but certainly, they should be the catalytic agents to see that parents, students, school administrators, employment service personnel, school board members, and prospective employers work together in giving proper visibility to occupational education.

I believe the vocational counselor should work as a teammate with the vocational teacher and employment service personnel; first, in determining needs for trained manpower in the various occupations; then interviewing, counseling, testing, and referring people into training programs, and finally, in seeing that they become gainfully employed.

The Arizona Employment Service employs approximately 40 vocational counselors who have at least a master's degree in vocational counseling so it is obvious that we must involve them if we hope to mobilize all of the help that is available in vocational counseling. In the past, we haven't known much about what happened to our high school and junior college graduates, but in the future, we must know. Congress as well as our state legislators, is becoming increasingly determined to know what specific benefits are realized from each tax dollar invested in education. Fortunately, placement and follow-up records on vocational graduates are relatively easy to develop and maintain through standardized reporting with the help of data processing equipment.

Arizona is precently compiling current enrollment data and follow-up on every student enrolled in vocational and technical education programs. Through the use of computerized cards we are able to know how well we are meeting the needs for trained manpower.

Another important dimension authorized under the Vocational Education Act of 1963 was the mandate to conduct research. We have known too little about the quality of our vocational programs, or how well we were meeting the needs of business and industry. We have been more concerned with our accomplishments than with our unmet needs. During recent years, we have spent less than one-half of one percent of our educational dollar on research, while those in business and industry were spending 10% of their gross income to disprove their most accepted practices.

With 10% of our vocational funds earmarked for research we are confronted with another challenge - that is to challenge, through research, the standards and traditions that have been developed in vocational education through the years and to which many hold with almost pious tenacity. Under the new act, we are encouraged to explore new and more effective ways of meeting the needs for trained manpower. Greater diversity, flexibility and adaptability should characterize our programs in the years ahead. We must avoid unrealistic, fixed, stereotyped curricula that are not geared to the needs of those we serve; and only through research and constant involvement of others concerned with manpower will we know how effective we are in meeting the demand for trained manpower.

In the past, our vocational program has been identified primarily with the secondary school but with the passage of the State Junior College Act and through our experience with the Manpower Development and Training Program, it appears that there will probably be greater emphasis on post-secondary vocational-technical education in the future. I do not mean to imply that there will be a shift from the secondary to the post-secondary, but merely an extension of the program from the secondary into the post-secondary institutions. Enrollment in the junior college vocational-technical program in our state has increased 125% since the passage of the Vocational Education Act of 1963. Certainly, the new act provided a real stimulus to this program, but other factors include the need for a broader and more extensive general education base: the increased maturity being demanded by employers, the increased restrictions regarding the employment of youth, minimum wage laws, and more specialized education required by changes in science and technology. Continuous training and retraining will be an essential part of tomorrow's worker, and the junior college appears to be uniquely well qualified to meet these needs.

Another challenge that is not confined to vocational educators is the need for <u>all</u> educators to show a greater concern for the world of work and to see the relevance of it to all education including general education. We need to provide career development patterns earlier in the school system through additional exploratory programs, including work experience where youth become aware of career opportunities, and become more able to realistically assess their own interest, aptitudes, and abilities as they relate to occupational requirements. I believe that schools should help youth to make the next step, whether it be to gain entry into a prestigious college or university or to successfully enter the world of work. How can they do less and still consider their programs comprehensive?

In my judgment, the public school system is the logical agency to be delegated the major responsibility for meeting the pre-employment training and retraining needs of the nation's labor force. We must move education out of its ivory tower and into the community. We should consider the entire community our classroom and every master tradesman, technician, or professional worker in it a potential member of our teaching staff.

We must prod ourselves not to fall in love with what we do well today, but be ever alert to strengthen our program for an unknown future. However, if we do not meet this challenge, so vital is the need that other agencies and groups will emerge or be created to do the job.

As evidence that this is no "straw man" issue, I would point out that of the 1.8 billion dollars appropriated by Congress for occupational education, only 280 million dollars is authorized for vocational training in high schools, area vocational schools, community and junior colleges and technical institutes.

There is presently a bill pending before Congress authorizing a maximum appropriation of one and one-half billion dollars for vocational education which I understand Mr. Cullison will discuss this afternoon. Although vocational education may

now be a junior member among federal aid programs, it rightfully enjoys a popularity and importance out of all proportion to the funds involved, and I believe will receive even more visibility and support in the years ahead.

Never before was vocational and technical education needed by so many people and I am proud of the progress we are making in meeting this need. But, only through your continued help and counsel can we feel secure and confident that our efforts and the tax dollar are being well invested.

Rest assured then that we recognize and appreciate the splendid contributions of the council and solicit your constant evaluation as well as support of our vocational programs in the years ahead.

WORKSHOP REPORTS

WORKSHOP REPORT NO. 1

GOVERNMENT AND HEALTH SERVICES

Leader:	Capt. Francis R. Kessler
Consultant:	Mrs. Shirley Mannion
Recorder:	Bill J. Murphey
Participants:	Col. Charles Ablett
	T.O. Beach
	Lee J. Beaudry
	Mary Ann Boehm
	Marie Booth
	Jackie Cables
	LeRoy Cafarello
	Jack Carter
	Tom Donohoe (D.D.S.)
	Mary Fried (M.D.)
	Hal Hamer
	Bill Hendrix (Ph.D)
	Mrs. Douglas Holsclaw
	Gladys Hooks
	John Huff
	Bob Kessler
	S. J. Kossack
	Thomas Lee (Ph.D)

G. Martin

Al Montoya

Bill Murphey

Yvonne Oliver

Allan J. Orler (M.D.)

Vic Smith

Gladys Sorensen (Ed.D)

Andrew G. Tremaine

WORKSHOP REPORT NO. 1

GOVERNMENT AND HEALTH SERVICES

I. TRENDS

A. Increased specialization due to technological advances

B. Development of sub-professional occupations, thereby freeing highly skilled technologists from non-professional duties.

C. Greater emphasis placed on on-the-job training.

D. Fewer and fewer applicants to fill technical positions. People are needed to fill these positions but the applicants do not take advantage of these open positions.

E. Counselors, particularly on the high school level, are becoming less and less aware of the number of jobs available and the qualifications necessary to fill them. New jobs are created each day of which the public is not aware.

F. Tendency for gap to increase between what is taught and what is occurring in the field. Technological advances are so rapid that curriculum rapidly becomes obsolete.

G. Individuals are promoted to higher positions but lack qualifications required for positions.

H. Compensation does not keep pace with skills acquired.

II. MANPOWER NEEDS

A. Clear definition for work skill requirements and job descriptions.

B. Better training and more training in specific areas.

C. Erase stigma attached to occupational education.

D. Educate students and parents regarding social acceptability of blue collar jobs.

E. Improve articulation and communication. Get information to the public.

F. More in-service training programs.

G. Provide more short term courses to fill the needs of such jobs as hydrologists, laboratory technicians, inhalation therapists, practical nurses, dental assistants, electronic technicians, audio-visual technicians, etc.

III. IMPLICATIONS

A. Community college should provide an opportunity for continuing education to keep up with the rapid industrial changes, to provide in-service training programs or any kind of courses for any length of time, to teach the skills necessary to fill the new positions created daily.

B. More opportunities for career exploration should be provided in the high school

C. More articulation and communication between business and schools so that the traditional curriculum can be altered and courses introduced that will meet the needs of our students of the community.

WORKSHOP REPORT NO. 2

WHOLESALE AND RETAIL

Leader:	Joe Schubert
Consultant:	Paul Bennewitz
Recorder:	Bill Antrim
Participants:	Frederick Bullard
	Jack Dillenger
	Dale Dunbar
	Dale Gibson
	Gary Greenberg
	Kenneth Hartman
	Richard Jacome
	Mrs. Ted Offret
	William Ricker
	George Sandoval

WORKSHOP REPORT NO. 2

WHOLESALE AND RETAIL

I. TRENDS

A. Increased introduction of data processing is changing both the content of jobs as well as the location of job performance.

B. Increased emphasis on equal opportunity for all means a broader spectrum of the population being considered for employment in jobs previously opened to the highly skilled.

C. Centralization of business activities has led to high degree of job specialization.

D. Contemporary attitudes toward employment have caused problems in relation to job satisfaction and motivation.

E. Longer business hours have led to increased employment of part-time help. This increases need for training of more personnel.

F. Increased operational cost and expanded fringe benefits require greater initial productivity for new employees, thus causing a need for greater degree of trained employment education. Education and individual potential are more readily accepted today in the business community in lieu of the actual business experience.

G. In-service training for all levels of personnel.

H. Automation and centralization decreases some job opportunities in some specific areas and increases job opportunities in other areas.

II. MANPOWER NEEDS

A. Businesses are looking for skilled employees to a greater extent than in the past.

B. Automation and data processing increases cause increase in need for clerical personnel.

C. Constant need for retraining.

D. Specialized technologists.

E. Follow-up training at junior college level for greater skilled developments.

F. Increase in occupational education programs to include more students. Expansion of occupational training areas in cooperative training programs to include more technical areas. 70% of students in these programs continue in occupational area for which they are trained. Present occupational programs are not satisfying needs in regard to quantity of individuals required.

G. Expand present programs and add higher levels of programs.

H. Improve articulation and communication

III. IMPLICATIONS

A. Mid-management program should be included in local junior college program.

B. Class offerings to organize towards skill rather than traditional concepts which are sometimes used.

C. Program should be devised to familiarize counselors with world of work.

D. More exposure of young people to actual work situations.

E. More use of industry and plant resources.

F. More use of private sets of people in training programs.

G. Awarding of funds into industry developed training programs for specific businesses.

H. Junior college program should include specific curriculum areas in marketing, merchandising, and management. Curriculums should be related to the stated needs of the industry.

I. Use of effective advisory groups.

WORKSHOP REPORT NO. 3

SERVICES AND TOURISM

Leader:	Eugene Adelstein
Consultant:	Eugene Dorr
Recorder:	Mary K. Bazzetta
Participants:	Margaret Booher
	Duane Brickner
	Anna Forrsell
	J. Knickerbocker
	Mary Lerche
	Nancy LeCompte
	Robert Minerich
	M. B. White
	Mrs. M. B. White

WORKSHOP REPORT NO. 3

SERVICES AND TOURISM

I. TRENDS

A. Basic lack of communication.

B. Shortage of help.

C. Advertising group for services and tourism is small and needs to be expanded.

D. Tucson is of low income nature.

E. Lack of promotion of the city by individuals.

II. MANPOWER NEEDS

A. More people willing to work in area of services and tourism.

B. Cooperative programs.

C. Improved means of communication.

D. Need personnel to follow-up students coming out of these courses.

III. IMPLICATIONS

A. More overall training programs to help personnel cope more efficiently with the public.

B. Hotel and restaurant training should be set up in line with some kind of educational program or cooperative program with hotel, motel, and restaurant people where people could actually get on-the-job training while they are going to school or junior college.

C. Shorter and intensive courses should be offered.

D. Set up a program in the junior college for retraining in the tourist industry. A survey of the industry itself should be made to determine what training is actually needed.

E. More stress should be placed on the importance of the job.

WORKSHOP REPORT NO. 4

MANUFACTURING AND MINING

Leader:	Max Gottschalk
Consultants:	Arthur C. Hall Marvin Seglem
Recorder:	Archie Romney
Participants:	Lon Adams
	Bill Carroll
	Otis Chidister
	Jim Davies
	Leon A. Dombrowski
	H. H. Dooley
	Art Flint
	Wally Forner
	Allan Hawthorne
	George Howard (Ph.D)
	Sol Levy
	J. K. Meyer
	Byron Nelson
	Charles K. Norling
	William Ricker
	Andrew W. Ross
	H. E. Rudi
	Mike Sandovall
	Andrew Stropko
	Walter Walker

WORKSHOP REPORT NO. 4

MANUFACTURING AND MINING

I. TRENDS

A. Lack of motivation for wanting to work.

B. Lack of technicians in areas of plumbing, electricity, air conditioning, drafting, layout of systems, and civil engineering. These are not the engineers; they are the technicians.

C. Diversification in vocational areas.

II. MANPOWER NEEDS

A. Trained technicians in all technical areas.

B. Should try to fill the natural laws of supply and demand in training.

C. For specialized domestic workers.

D. For specialists in heliarc welding, ordinary welding, and layout.

III. IMPLICATIONS

A. Industry should communicate its needs to the Arizona Employment Office. There should be communication between education, government, and the public.

B. Counselors should be exposed to each actual industry for several months in the area of which they are advising. They should respond to individuals specific industrial requirements.

C. There should be great flexibility of curriculums which should adapt to change.

D. No programs should be started without the advice of an advisory committee composed of labor and management.

E. There should be a different atmosphere between academic and vocational training. Upgrade vocational-technical training in the community. Remove the stigma and make it be as admired as the academic training.

F. Coordinate the activities of the high school, junior college, adult education offerings so that the students may progress most expeditiously.

G. The family should be trained for communicating the concept of the status of the occupational technician.

H. An orientation for industry and the interpersonal relationships that are involved in labor.

WORKSHOP REPORT NO. 5

FINANCIAL, REAL ESTATE, AND CONTRACT CONSTRUCTION

Leader:	Mark Klafter
Consultant:	R. Dean Frey
Recorder:	Frances Holt
Participants:	Lew Davis
	Florence Johnoff
	Jim Kingston
	Sally Lewis
	Helen Lowery
	Henry Shearrill
	Louie Strubinger

WORKSHOP REPORT NO. 5

FINANCIAL, REAL ESTATE
AND CONTRACT CONSTRUCTION

I. TRENDS

A. Banks do their own training and have their own educational programs offered, for example, by the American Institute of Banking. They teach such things as banking operation, trusts, etc. They have their own co-op training program and operator-teller school.

B. Use practice of learn-while-you-earn. Installment credit and teller jobs are done with on-the-job training.

C. Tellers are limited to an age of 21 years because of large amounts of money involved. Bank tests its own employees.

D. Computers have replaced entry level jobs.

E. Interested in older age group.

II. MANPOWER NEEDS

A. More programmers, computer operators, etc.

B. Tellers, credit personnel, and secretarial people are greatest area for entry level jobs.

C. Need more bilingual Spanish-American people.

III. IMPLICATIONS

A. Junior college should provide programs in accounting and training for teller work.

B. Wide open for the 30-35-40 year old housewife who is looking for not quite full-time employment.

C. More personnel management courses for present management people.

D. Adult auxillary type course to offer such courses as real estate law and elementary appraisal to people already in the field. They should be taught by real estate personnel rather than full-time college staff.

WORKSHOP REPORT NO. 6

AGRICULTURE

Leader:	Steve Fazio
Consultant:	Carlos Moore
Recorder:	Louis Bazzetta
Participants:	Maurice Bossuyt
	Rainy Davis
	Brad DeSpain
	Paul Frick
	W. H. Garrett
	Dale Gladden
	Mrs. Dale Gladden
	James Hamilton (Ph.D)
	Lefty Lefler
	Bob Lynch
	Al Oshrin
	Alfred Vietri

WORKSHOP REPORT NO. 6

AGRICULTURE

I. TRENDS

A. Population increases.

B. A broadening of agriculture from farming and ranching to include other services that depend upon agriculture.

C. Occupations vary from unskilled, semi-skilled, skilled, to highly technical.

D. Due to mechanical and technical advances, small farms are disappearing. Mass production has taken over. Local nurserys are finding difficulty in competing with large companies on coast who are importing their landscaping stock instead of growing their own.

E. Mechanization is a big trend. The picking of cotton, lettuce, grapes, and other vegetables have an impact.

F. The public is becoming more aware of education for all. It provides many levels of interest and many advances.

II. MANPOWER NEEDS

A. All levels of training.

B. Persons with broader base in agriculture to handle many jobs required on some of the farms as well as the highly specialized technicians.

C. More cooperative programs between the farmer, nurseryman, teacher, and student to provide a realistic program.

D. More cooperation between the disciplines in the school. A boy that is going into agribusiness could greatly profit from the short course or unit in distributive education.

E. Short, intensive programs based upon needs of people in farming line giving length needed and required to obtain desired goals and outcomes.

III. IMPLICATIONS

A. Formation of local committees and a county advisory committee in the area of agriculture. Local committee members should be represented on county advisory committee so there will be a continuous planned program.

B. Consideration should be given to providing a certificate to students indicating a level of proficiency achieved. This will provide better placement and better articulation between the schools.

C. Training in agriculture be given on the junior college level.

PART V

SUMMARY AND IMPLICATIONS

SUMMARY AND IMPLICATIONS

by

Dr. Oliver H. Laine
President, Pima College

It has been very pleasing to me to witness today's activities which have brought together more than one hundred employers and key administrators in Pima County. We have discussed the things that we set out to discuss this morning -- manpower projections, the role of occupational education, and the trends and implications for education. We have addressed ourselves to those attending high school, those who have completed or left high school and who are available for full-time study, those who have entered the labor market and need retraining or training, and those who have academic or socioeconomic handicaps.

After listening to the recommendations, I can already see that if we had another conference we would have more counselors here for one thing. I was amused a little about the idea of status, although it really isn't funny. It reminds me of the time I was in Europe, right after the war, and a member of the Occupation Air Force. Everybody in Germany seemed to be carrying a brief case. Maybe that is the thing we ought to do -- give everyone an attache' case and maybe we can develop some status. (joking of course) But sometimes little things like that make a great deal of difference. We need to think of more substantive ways in which to develop status and dignity in our people at all levels.

It has been a profitable day, I believe, simply because I have come to know many of you much better; and I have come to know some of you for the first time, but I hope not for the last time. As we stated in this morning's directions to you, we were hopeful that the results of today's conference would bring about certain desired outcomes -- the establishment and maintenance of effective lines of communication between business, industries, and the educational system of Pima County, including Pima College of course, the development of guidelines for planning, programming, and budgeting occupational education programs, and finally I believe we have come a long way to develop the concept of occupational education as an instrument of the manpower development system.

I believe it has been a wonderful conference in every respect; and I am sure that we, as we address ourselves at Pima College to priority for curriculums and programs, will be guided by the many fine suggestions; and hopefully, we can find the resources in manpower, money, and facilities to implement them very soon. However, we must always set up priorities; and eventhough we may not relate or react immediately to some of these things, it isn't because we don't want to. I would assure you of that.

Finally, I would like to pay my respects and show my appreciation to a young man who just came on my staff April 1 who immediately took in hand the arrangements for this conference. I believe we all owe Dr. Robert Kerwood a round of applause for the work that he has done in bringing this conference into being.
